## EMC Dell Technologies PowerMax Operate Sample Questions (Q70-Q75):

### NEW QUESTION # 70

Which services are active after a Unisphere for PowerMax installation on a Microsoft Windows host?

- A. SMAS and smasdb
- B. SMASandSTP
- C. SMASandGNS
- D. SYMAPI and symrdfg

**Answer: A**

Explanation:

Step by Step Comprehensive Detailed Explanation:

When you install Unisphere for PowerMax on a Microsoft Windows host, it installs several services necessary for its operation. The two primary services that are active after installation are:

- \* SMAS (Storage Management Agent Service): This service is responsible for communication between the Unisphere server and the PowerMax storage array. It handles tasks like collecting data, sending commands, and receiving alerts from the array.
- \* smasdb: This service manages the local database used by Unisphere for storing configuration information, performance data, and other relevant information.

Why other options are incorrect:

- \* A. SYMAPI and symrdfg: SYMAPI is a command-line interface tool, not a service. symrdfg is a service related to SRDF (Symmetrix Remote Data Facility) replication, which may not be active if SRDF is not configured.
- \* B. SMASandGNS: GNS is not a standard service associated with Unisphere for PowerMax.
- \* C. SMASandSTP: STP is not a standard service associated with Unisphere for PowerMax.

- \* Dell Unisphere for PowerMax 10.0.0 Installation Guide: This guide provides detailed instructions for installing Unisphere for PowerMax on different operating systems, including Windows. It also lists the services that are installed and their functions. You can find this document on the Dell Support website by searching for "Unisphere for PowerMax Installation Guide."
- \* Dell Unisphere for PowerMax 10.0.0 Online Help: The online help documentation for Unisphere may also provide information about the services it uses and their roles.

### NEW QUESTION # 71

From an application perspective what should be done prior to performing an SRDF Fallback operation?

- A. Stop accessing the R2 devices  
Run the command and then start accessing the R1 devices
- B. Continue accessing the R2 devices  
Run the command and then start accessing the R1 devices
- C. Stop accessing the R2 devices  
Start accessing the R1 devices before running the command
- D. Continue accessing the R2 devices  
Start accessing the R1 devices before running the command

**Answer: A**

### NEW QUESTION # 72

A host has LUNs assigned through a Masking View containing one regular Storage Group. The Storage Group has the gold service level assigned. One LUN requires a higher service level. What is the correct sequence of steps required to assign the platinum service level to that LUN?

**Answer:**

Explanation:

### NEW QUESTION # 73

A storage administrator is using SE 10 to query a PowerMax 2000 using symcfg list -dir and wants to see the number of Cores that are assigned to the front-end emulations. What does the storage administrator need to do?

- A. Look for CPU instead of Cores as these have been rebranded to allow differentiating between virtual and physical hardware.
- **B. Use the -mode v9x argument for backwards compatibility as some output has been deprecated**
- C. Specify the full 12-digit serial number with -sid so SE 10 understands the output relates to an older system model.
- D. Use syraconfigure -version -dir as in SE 10 support for outputs specific to older systems moved to a different command.

**Answer: B**

Explanation:

Step by Step Comprehensive Detailed Explanation:

Solutions Enabler (SE) 10 introduces some changes to the output format of certain commands for better clarity and consistency. When querying a PowerMax 2000 (which is based on older VMAX architecture) using symcfg list -dir, you might encounter differences in the output compared to previous SE versions.

To ensure backward compatibility and see the output in the familiar format, you need to use the -mode v9x argument. This tells SE 10 to display the output in the style of SE 9.x, which is compatible with the PowerMax 2000.

Why other options are incorrect:

- \* B. Look for CPU instead of Cores as these have been rebranded...While there might be terminology changes, this is not the primary reason for the output difference.
- \* C. Specify the full 12-digit serial number with -sid so SE 10 understands...The serial number is not directly related to the output format.
- \* D. Use syraconfigure -version -dir as in SE 10 support for outputs...The syraconfigure command is not the correct command for this purpose.

References and documents of Dell's public documentation for PowerMax Operate v.2:

\* Dell Solutions Enabler 10.0.0 CLI User Guide: This guide provides detailed information about the symcfg command and its options, including the -mode argument for backward compatibility. You can find this document on the Dell Support website by searching for "Solutions Enabler CLI User Guide."

### NEW QUESTION # 74

An administrator is using the Workload Planner feature in Unisphere for PowerMax. How does the Planner calculate if the Storage Group workload is stable?

- A. One of the calculated values remains within the SL-defined response time

- B. One of the calculated values is within 10-20% of the SL-defined response time
- C. Both calculated values are within a 10-15% threshold of the SL-defined response time
- D. Both calculated values are within the SL-defined response time.

#### Answer: D

Explanation:

Step by Step Comprehensive Detailed Explanation:

The Workload Planner in Unisphere for PowerMax helps you analyze and predict the performance impact of adding new workloads to your storage array. It uses sophisticated algorithms to calculate how the addition of a new workload will affect the existing workloads and whether it will violate any service level objectives (SLOs).

To determine if a Storage Group workload is stable, the Planner considers two key calculated values:

\* Read Response Time: The predicted read response time of the Storage Group after the new workload is added.

\* Write Response Time: The predicted write response time of the Storage Group after the new workload is added.

The Planner compares these calculated values against the service level (SL) defined for the Storage Group. If both the calculated read and write response times fall within the defined SL response time, the Planner considers the workload to be stable. This means that the new workload can be added without negatively impacting the performance of the existing workloads or violating the SLOs.

Why other options are incorrect:

\* A. One of the calculated values is within 10-20% of the SL-defined response time: Both read and write response times must be within the defined SL, not just one.

\* B. Both calculated values are within a 10-15% threshold of the SL-defined response time: The threshold is not fixed at 10-15%. The calculated values must be within the actual SL-defined response time.

\* C. One of the calculated values remains within the SL-defined response time: Again, both read and write response times need to be within the defined SL.

References and documents of Dell's public documentation for PowerMax Operate v.2:

\* Dell Unisphere for PowerMax 10.0.0 Online Help: The online help for Unisphere provides detailed information about the Workload Planner feature, including how it calculates and analyzes workload stability. You can access this help within Unisphere itself or on the Dell Support website.

\* Dell PowerMax Family: Essentials and Best Practices Guide: This guide may offer general information about performance management and workload planning in PowerMax, providing context for understanding the Workload Planner's functionality.
