

Features of Pass4sures Terraform-Associate-004 PDF and Practice Exams

The Pass4sures HashiCorp Terraform-Associate-004 exam questions is 100% verified and tested. Pass4sures HashiCorp Terraform-Associate-004 exam practice questions and answers is the practice test software. In Pass4sures, you will find the best exam preparation material. The material including practice questions and answers. The information we have could give you the opportunity to practice issues, and ultimately achieve your goal that through HashiCorp Terraform-Associate-004 Exam Certification.

HashiCorp Terraform-Associate-004 Exam Syllabus Topics:

Topic	Details
Topic 1	Core Terraform workflow: This domain focuses on the essential workflow steps: initializing directories, validating configurations, generating execution plans, applying changes, destroying infrastructure, and formatting code.
Topic 2	Terraform modules: This domain explains organizing and reusing code through modules, understanding variable scope between modules, implementing modules in configurations, and managing module versions.
Topic 3	Terraform fundamentals: This domain addresses installing and managing provider plugins, understanding Terraform's provider architecture, and how Terraform tracks infrastructure state.
Topic 4	HCP Terraform: This domain covers using HashiCorp Cloud Platform Terraform for infrastructure provisioning, collaboration and governance features, organizing workspaces and projects, and configuring integrations.

Terraform-Associate-004 New Braindumps | Terraform-Associate-004 Exam PDF

Our Terraform-Associate-004 exam guide has high quality of service. We provide 24-hour online service on the Terraform-Associate-004 training engine. If you have any questions in the course of using the bank, you can contact us by email. We will provide you with excellent after-sales service with the utmost patience and attitude. And we will give you detailed solutions to any problems that arise during the course of using the Terraform-Associate-004 learning braindumps. And our Terraform-Associate-004 study materials welcome your supervision and criticism.

HashiCorp Certified: Terraform Associate (004) (HCTA0-004) Sample Questions (Q146-Q151):

NEW QUESTION # 146

When does Terraform create the .terraform.lock.hcl file?

- A. When you enable state locking
- B. After your first terraform plan
- C. After your first terraform init
- D. After your first terraform apply

Answer: C

Explanation:

Terraform creates the .terraform.lock.hcl file after the first terraform init command. This lock file ensures that the dependencies for your project are consistent across different runs by locking the versions of the providers and modules used.

NEW QUESTION # 147

Which of the following should you add in the required_providers block to define a provider version constraint?

- A. version = ">= 3.1"
- B. version >= 3.1
- C. version ~> 3.1

Answer: A

Explanation:

Rationale for Correct Answer (C):

Version constraints must be specified with = and quotes, e.g.:

version = ">= 3.1"

This ensures compatibility with Terraform's syntax.

Analysis of Incorrect Options:

A, B: Incorrect syntax, missing quotes or wrong operator format.

C: Correct Terraform syntax.

Key Concept:

Correct syntax in provider version constraints ensures reproducibility.

Reference: Terraform Exam Objective - Manage Terraform Resources and Providers.

NEW QUESTION # 148

Where in your Terraform configuration do you specify a state backend?

- A. The terraform block
- B. The data source block
- C. The resource block
- D. The provider block

Answer: A

Explanation:

In Terraform, the backend configuration, which includes details about where and how state is stored, is specified within the terraform block of your configuration. This block is the correct place to define the backend type and its configuration parameters, such as the location of the state file for a local backend or the bucket details for a remote backend like S3. References = This practice is outlined in Terraform's core documentation, which provides examples and guidelines on how to configure various aspects of Terraform's behavior, including state backends .

NEW QUESTION # 149

A developer accidentally launched a VM (virtual machine) outside of the Terraform workflow and ended up with two servers with the same name. They don't know which VM Terraform manages but do have a list of all active VM IDs.

Which of the following methods could you use to discover which instance Terraform manages?

- A. Run terraform taint/code on all the VMs to recreate them
- **B. Run terraform state list to find the names of all VMs, then run terraform state show for each of them to find which VM ID Terraform manages**
- C. Use terraform refresh/code to find out which IDs are already part of state
- D. Update the code to include outputs for the ID of all VMs, then run terraform plan to view the outputs

Answer: B

Explanation:

The terraform state list command lists all resources that are managed by Terraform in the current state file1. The terraform state show command shows the attributes of a single resource in the state file2. By using these two commands, you can compare the VM IDs in your list with the ones in the state file and identify which one is managed by Terraform.

NEW QUESTION # 150

Terraform configuration can only import modules from the public registry.

- A. True
- **B. False**

Answer: B

Explanation:

Terraform configuration can import modules from various sources, not only from the public registry. Modules can be sourced from local file paths, Git repositories, HTTP URLs, Mercurial repositories, S3 buckets, and GCS buckets. Terraform supports a number of common conventions and syntaxes for specifying module sources, as documented in the [Module Sources] page. References = [Module Sources]
