TroytecDumps are supposed to help you pass the exam smoothly. Do not worry about channels to the best Certificate of Competence in Zero Trust (CCZT) CCZT study materials because we are the exactly best vendor in this field for more than ten years. And so many exam candidates admire our generosity of the Cloud Security Alliance CCZT Practice Questions offering help for them. Up to now, no one has ever challenged our leading position of this area.

Cloud Security Alliance Certificate of Competence in Zero Trust (CCZT) Sample Questions (Q15-Q20):

NEW QUESTION # 15
Which of the following is a key principle of ZT and is required for its implementation?

- A. Making no assumptions about an entity's trustworthiness when it requests access to a resource
- B. Encrypting all communications between any two endpoints
- C. Requiring that authentication and explicit authorization must occur after network access has been granted
- D. Implementing strong anti-phishing email filters

Answer: A

Explanation:
One of the core principles of Zero Trust (ZT) is to "never trust, always verify" every request for access to a resource, regardless of where it originates or what resource it accesses1. This means that ZT does not rely on implicit trust based on network perimeters, device types, or user roles, but rather on explicit verification based on multiple data points, such as user identity, device health, location, service, data classification, and anomalies1.

NEW QUESTION # 16

Which architectural consideration needs to be taken into account
while deploying SDP? Select the best answer.

- A. How SDP deployment fits into application validation.
- B. How SDP deployment fits into external vendor assessment.
- C. How SDP deployment fits into existing human resource
  management systems.
- D. How SDP deployment fits into existing network topologies and
  technologies.

Answer: D

Explanation:
A key architectural consideration that needs to be taken into account while deploying SDP is how SDP deployment fits into existing network topologies and technologies. This is because SDP deployment may require changes or adaptations to the existing network infrastructure, such as routers, switches, firewalls, VPNs, etc. SDP deployment may also affect the network performance, availability, scalability, and resilience.
Therefore, it is important to assess the impact and compatibility of SDP deployment with the existing network topologies and technologies, and to plan and design the SDP deployment accordingly.

NEW QUESTION # 17

Which vital ZTA component enhances network security and
simplifies management by creating boundaries between resources
in the same network zone?

- A. Authentication request/validation request (AR/VR)
- B. Session establishment or termination
- C. Decision transmission
- D. Micro-segmentation

Answer: D

Explanation:
Micro-segmentation is a vital ZTA component that enhances network security and simplifies management by creating boundaries between resources in the same network zone. Micro-segmentation divides the network into smaller segments or zones based on the attributes and context of the resources, such as data sensitivity, application functionality, user roles, etc. Micro-segmentation helps to isolate and protect the resources from unauthorized access and lateral movement of attackers within the same network zone.

NEW QUESTION # 18

Scenario: A multinational org uses ZTA to enhance security. They
collaborate with third-party service providers for remote access to
specific resources. How can ZTA policies authenticate third-party
users and devices for accessing resources?

- A. ZTA policies can be configured to authenticate third-party users
  and their devices, determining the necessary access privileges for
  resources while concealing all other assets to minimize the attack

surface.

- B. ZTA policies can implement robust encryption and secure access controls to prevent access to services from stolen devices, ensuring that only legitimate users can access mobile services.
- C. ZTA policies should prioritize securing remote users through technologies like virtual desktop infrastructure (VDI) and corporate cloud workstation resources to reduce the risk of lateral movement via compromised access controls.
- D. ZTA policies should primarily educate users about secure practices and promote strong authentication for services accessed via mobile devices to prevent data compromise.

Answer: A

Explanation:
ZTA is based on the principle of never trusting any user or device by default, regardless of their location or ownership. ZTA policies can use various methods to verify the identity and context of third-party users and devices, such as tokens, certificates, multifactor authentication, device posture assessment, etc. ZTA policies can also enforce granular and dynamic access policies that grant the minimum necessary privileges to third-party users and devices for accessing specific resources, while hiding all other assets from their view.
This reduces the attack surface and prevents unauthorized access and lateral movement within the network.

NEW QUESTION # 19
Scenario: An organization is conducting a gap analysis as a part of its ZT planning. During which of the following steps will risk appetite be defined?

- A. Determine the current state
- B. Create a roadmap
- C. Define requirements
- D. Determine the target state

Answer: C

Explanation:
Explanation
During the define requirements step of ZT planning, the organization will define its risk appetite, which is the amount and type of risk that it is willing to accept in pursuit of its objectives. Risk appetite reflects the organization's risk culture, tolerance, and strategy, and guides the development of the ZT policies and controls. Risk appetite should be aligned with the business priorities and needs, and communicated clearly to the stakeholders.
