NEW QUESTION # 76

Why would you choose the "Validate Remote Tables" feature in the SAP Datasphere repository explorer?

- A. To preview data of remote tables
- B. To detect if remote tables are defined that are not used in Views
- C. To test if data has been replicated completely
- **D. To identify structure updates of the remote sources**

Answer: D

Explanation:

The "Validate Remote Tables" feature in the SAP Datasphere repository explorer is primarily used to identify structure updates of the remote sources. When a remote table is created in Datasphere, it establishes a metadata connection to a table or view in an external source system. Over time, the structure of the source object (e.g., column additions, deletions, data type changes) might change. The "Validate Remote Tables" function allows you to compare the metadata currently stored in Datasphere for the remote table with the actual, current metadata in the source system. If discrepancies are found, Datasphere can highlight these structural changes, prompting you to update the remote table's definition within Datasphere to match the source. This ensures that views and data flows built on these remote tables continue to function correctly and align with the underlying source structure, preventing data access issues or incorrect data interpretations.
