## Pass 2V0-41.24 Exam with Perfect Certification 2V0-41.24 Cost by Dumps4PDF

Passing an exam isn't an easy thing for some candidates, if you choose the 2V0-41.24 training materials of us, we will make the exam easier for you. 2V0-41.24 training materials include knowledge points, you can remember them through practicing. 2V0-41.24 questions and answers will list the right answer for you, what you need to do is to practice them. In addition, there are experienced specialists checking the 2V0-41.24 Exam Dumps, they will ensure the timely update for the latest version.

## VMware NSX 4.X Professional V2 Sample Questions (Q127-Q132):

### NEW QUESTION # 127

What should an NSX administrator check to verify that VMware Identity Manager integration is successful?

- A. From the NSX CLI the status of the VMware Identity Manager Integration must be Configured!
- B. From VMware Identity Manager the status of the remote access application must be green
- C. From the NSX UI the URI in the address bar must have locaMalstf part of it.
- D. From the NSX UI the status of the VMWare Identity Manager Integration must be Enabled!

Answer: A

Explanation:

To verify that VMware Identity Manager integration is successful with NSX, the administrator should check the NSX UI for the integration status. If it is configured correctly, the status should be marked as "Enabled," indicating that the integration is active and functioning.

### NEW QUESTION # 128

What are four NSX built-in role-based access control (RBAC) roles? (Choose four.)

- A. LB Operator
- B. Network Admin
- C. Auditor
- D. None
- E. Enterprise Admin
- F. Read
- G. Full Access

**Answer: A,B,C,E**

Explanation:

<https://docs.vmware.com/en/VMware-NSX/4.1/administration/GUID-26C44DE8-1854-4B06-B6DA-A2FD426CDF44.html>

### NEW QUESTION # 129

An administrator wants to validate the BGP connection status between the Tier-O Gateway and the upstream physical router. What sequence of commands could be used to check this status on NSX Edge node?

- A. show logical-routers  
get vrf  
show ip route bgp
- B. enable <LR-D> get vrf <ID>  
show bgp neighbor
- C. set vrf <ID> show logical-routers show <LR-D> bgp
- D. get gateways  
vrf <number>  
get bgp neighbor

**Answer: D**

Explanation:

The sequence of commands that could be used to check the BGP connection status between the Tier-O Gateway and the upstream physical router on NSX Edge node is get gateways, vrf <number>, get bgp neighbor. These commands can be executed on the NSX Edge node CLI after logging in as admin6. The first command, get gateways, displays the list of logical routers (gateways) configured on the Edge node, along with their IDs and VRF numbers7. The second command, vrf <number>, switches to the VRF context of the desired Tier-O Gateway, where <number> is the VRF number obtained from the previous command7. The third command, get bgp neighbor, displays the BGP neighbor summary for the selected VRF, including the neighbor IP address, AS number, state, uptime, and prefixes received8. The other options are incorrect because they either use invalid or incomplete commands or do not switch to the correct VRF context.

### NEW QUESTION # 130

Which two commands does an NSX administrator use to check the IP address of the VMkernel port for the Geneve protocol on the ESXi transport node? (Choose two.)

- A. esxcfg-vmknic -l
- B. net-dvs
- C. esxcfg-nics -l
- D. esxcli network ip interface ipv4 get

- E. esxcli network nic list

**Answer: D**

Explanation:

The esxcli network ip interface ipv4 get command is used to display the IP address configuration of the VMkernel network interfaces, including those used for the Geneve protocol.

The esxcfg-vmknic -l command lists all VMkernel network interfaces, including their IP addresses, which can help identify the VMkernel port for the Geneve protocol.

### NEW QUESTION # 131

What are two supported host switch modes? (Choose two.)

- A. Overlay Datapath
- **B. Enhanced Datapath**
- C. DPDK Datapath
- D. Secure Datapath
- **E. Standard Datapath**

**Answer: B,E**

Explanation:

The host switch modes determine how the NSX network and security stack is allocated on the underlying host CPU or DPU. There are two supported host switch modes: Enhanced Datapath and Standard Datapath. Enhanced Datapath mode leverages the DPU to offload the NSX datapath processing from the host CPU, while Standard Datapath mode uses the host CPU for the NSX datapath processing. DPDK Datapath, Overlay Datapath, and Secure Datapath are not valid host switch modes for NSX 4.x.
