### Fortinet FCSS - Enterprise Firewall 7.4 Administrator Sample Questions (Q41-Q46):

#### NEW QUESTION # 41

An administrator must minimize CPU and RAM use on a FortiGate firewall while also enabling essential security features, such as web filtering and application control for HTTPS traffic.

Which SSL inspection setting helps reduce system load while also enabling security features, such as web filtering and application control for encrypted HTTPS traffic?

- A. Configure SSL inspection to handle HTTPS traffic efficiently.
- **B. Enable SSL certificate inspection mode to perform basic checks without decrypting traffic.**
- C. Disable SSL inspection entirely to conserve resources.
- D. Use full SSL inspection to thoroughly inspect encrypted payloads.

**Answer: B**

Explanation:

To minimize CPU and RAM usage while still enforcing security features like web filtering and application control, SSL certificate inspection mode is the best choice.

# SSL certificate inspection allows FortiGate to inspect only the SSL/TLS handshake, including the Server Name Indication (SNI) and certificate details, without decrypting the full encrypted payload.

# This enables features like web filtering and application control because FortiGate can determine the destination website or application based on SNI and certificate information.

# It significantly reduces system load compared to full SSL inspection, which requires full decryption and re-encryption of traffic.

#### NEW QUESTION # 42

A FortiGate device with UTM profiles is reaching the resource limits, and the administrator expects the traffic in the enterprise network to increase.

The administrator has received an additional FortiGate of the same model.

Which two protocols should the administrator use to integrate the additional FortiGate device into this enterprise network? (Choose two.)

- **A. FGSP with external load balancers**
- **B. FGCP in active-active mode and with switches**
- C. FGCP in active-passive mode and with VDOM disabled
- D. VRRP with switches

**Answer: A,B**

Explanation:

When adding an additional FortiGate to an enterprise network that is already reaching its resource limits, the goal is to distribute traffic efficiently and ensure high availability.

FGSP (FortiGate Session Life Support Protocol) with external load balancers FGSP allows session-aware load balancing between multiple FortiGate units without requiring them to be in an HA (High Availability) cluster.

With external load balancers, incoming traffic is evenly distributed across multiple FortiGate devices.

This approach is useful for scaling out traffic handling capacity while ensuring that sessions remain synchronized between firewalls.

FGSP is effective when stateful failover is required but without the constraints of traditional HA.

FGCP (FortiGate Clustering Protocol) in active-active mode and with switches FGCP active-active mode enables multiple FortiGate devices to share traffic loads, increasing throughput and efficiency.

Active-active mode is suitable for balancing UTM processing across multiple FortiGates, making it ideal when resource limits are a concern.

Using switches ensures redundancy and avoids single points of failure in the network.

This mode is commonly used in enterprise networks where both scalability and redundancy are required.

### NEW QUESTION # 43

What does DHCP snooping MAC verification do?

- C. Drops DHCP packets with no relay agent information (option 82) on untrusted ports
- D. Drops DHCP release packets on untrusted ports

Answer: B
