Reliable AWS-Solutions-Architect-Associate Test Answers & AWS-Solutions-Architect-Associate Exam Flashcards

With the help of our AWS-Solutions-Architect-Associate Latest Dumps Pdf, you just need to spend one or two days to practice the AWS-Solutions-Architect-Associate training materials. If you remember the key points of study guide, you will pass the real exam

with hit-rate. You can trust us about the valid and accuracy of Amazon braindumps because it created by our experienced workers and based on the real questions.

Amazon AWS-Solutions-Associate, also known as the AWS Certified Solutions Architect - Associate (SAA-C02) certification exam, is a valuable credential for IT professionals looking to demonstrate their expertise in designing and deploying scalable, highly available, and fault-tolerant systems on Amazon Web Services (AWS) cloud platform.

Amazon AWS-Solutions-Associate (AWS Certified Solutions Architect - Associate (SAA-C02)) Certification Exam is a globally recognized certification in the field of cloud computing. AWS-Solutions-Architect-Associate Exam validates the skills and knowledge necessary to design and deploy scalable, highly available, and fault-tolerant systems on the Amazon Web Services (AWS) platform. AWS Certified Solutions Architect - Associate (SAA-C03) certification exam is designed for professionals who have a minimum of one year of experience with AWS and are proficient in designing and deploying scalable, fault-tolerant, and highly available systems.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q252-Q257):

NEW QUESTION # 252

A company has created an image analysis application in which users can upload photos and add photo frames to their images. The users upload images and metadata to indicate which photo frames they want to add to their images. The application uses a single Amazon EC2 instance and Amazon DynamoDB to store the metadata.

The application is becoming more popular, and the number of users is increasing. The company expects the number of concurrent users to vary significantly depending on the time of day and day of week. The company must ensure that the application can scale to meet the needs of the growing user base.

Which solution meets these requirements?

- A. Use AWS Lambda to process the photos. Store the photos and metadata in DynamoDB.
- B. Use Amazon Kinesis Data Firehose to process the photos and to store the photos and metadata.
- **C. Use AWS Lambda to process the photos. Store the photos in Amazon S3. Retain DynamoDB to store the metadata.**
- D. Increase the number of EC2 instances to three. Use Provisioned IOPS SSD (io2) Amazon Elastic Block Store (Amazon EBS) volumes to store the photos and metadata.

Answer: C

Explanation:

Explanation

<https://www.quora.com/How-can-I-use-DynamoDB-for-storing-metadata-for-Amazon-S3-objects> This solution meets the requirements of scalability, performance, and availability. AWS Lambda can process the photos in parallel and scale up or down automatically depending on the demand. Amazon S3 can store the photos and metadata reliably and durably, and provide high availability and low latency. DynamoDB can store the metadata efficiently and provide consistent performance. This solution also reduces the cost and complexity of managing EC2 instances and EBS volumes.

Option A is incorrect because storing the photos in DynamoDB is not a good practice, as it can increase the storage cost and limit the throughput. Option B is incorrect because Kinesis Data Firehose is not designed for processing photos, but for streaming data to destinations such as S3 or Redshift. Option D is incorrect because increasing the number of EC2 instances and using Provisioned IOPS SSD volumes does not guarantee scalability, as it depends on the load balancer and the application code. It also increases the cost and complexity of managing the infrastructure.

NEW QUESTION # 253

A company is running a batch application on Amazon EC2 instances. The application consists of a backend with multiple Amazon RDS databases. The application is causing a high number of reads on the databases. A solutions architect must reduce the number of database reads while ensuring high availability.

What should the solutions architect do to meet this requirement?

- A. Use AmazonElastiCache for Redis
- **B. Add Amazon RDS read replicas**
- C. Use Amazon ElastiCache for Memcached

- D. Use Amazon Route 53 DNS caching

Answer: B

Explanation:

This solution meets the requirement of reducing the number of database reads while ensuring high availability for a batch application that consists of a backend with multiple Amazon RDS databases. Amazon RDS read replicas are copies of the primary database instance that can serve read-only traffic. You can create one or more read replicas for a primary database instance and connect to them using a special endpoint. Read replicas can improve the performance and availability of your application by offloading read queries from the primary database instance.

Option B is incorrect because using Amazon ElastiCache for Redis can provide a fast, in-memory data store that can cache frequently accessed data, but it does not support replication from Amazon RDS databases.

Option C is incorrect because using Amazon Route 53 DNS caching can improve the performance and availability of DNS queries, but it does not reduce the number of database reads. Option D is incorrect because using Amazon ElastiCache for Memcached can provide a fast, in-memory data store that can cache frequently accessed data, but it does not support replication from Amazon RDS databases.

NEW QUESTION # 254

An application stores data in an Amazon RDS MySQL DB instance. The database traffic primarily consists of read queries, which are overwhelming the current database. A Solutions Architect wants to scale the database.

What combination of steps will achieve the goal? (Choose two.)

- A. Migrate the MySQL database to Amazon Aurora
- **B. Create read replicas in different Availability Zones**
- **C. Create an ELB Application Load Balancer**
- D. Migrate the MySQL database to a PostgreSQL database
- E. Add the MySQL database instances to an Auto Scaling group

Answer: B,C

NEW QUESTION # 255

A Company will run different data analytics jobs on large petabyte-scale datasets, Using standard SQL and existing business intelligence tools. The data is mostly structured, but part of the data unstructured and resides in Amazon S3.

What Technologies should be used to support this use case?

- A. Amazon DynamoDB with Amazon DynamoDB Accelerator.
- B. An amazon aurora database cluster with 15 replicas distributed across availability zones.
- C. Amazon ElastiCache for Redis with cluster mode Enabled.
- **D. Amazon Redshift with Amazon Redshift Spectrum**

Answer: D

NEW QUESTION # 256

A media company has more than 100TB of data to be stored and retrieved infrequently. However the company occasionally receives requests for data within an hour The company needs a low- cost retrieval method to handle the requests.

Which service meets this requirement?

- A. Amazon S3 Standard
- **B. Amazon S3 Standard Infrequent Access**
- C. Amazon Glacier bulk retrievals
- D. Amazon Glacier standard retrievals

Answer: B
