- A. The user\s default shell
- B. The user's storage space limit
- C. The encrypted password
- D. The numerical user ID
- E. The username

Answer: C,D,E

NEW QUESTION # 27
What is the preferred source for the installation of new applications in a Linux based operating system?

- A. The vendor's version management system
- B. The distribution's package repository
- C. The vendor's website
- D. A CD-ROM disk
- E. A retail store

Answer: B

Explanation:
The distribution's package repository is the preferred source for the installation of new applications in a Linux based operating system. A package repository is a collection of software packages that are maintained by the distribution and can be easily installed, updated, or removed using a package manager. Package repositories offer several advantages, such as:
They ensure compatibility and stability with the system and other packages.
They provide security updates and bug fixes for the packages.
They reduce the risk of malware or corrupted files.
They simplify the dependency management and configuration of the packages.
The other sources are not preferred because they may not offer these benefits and may cause problems with the system. The vendor's version management system, the vendor's website, or a CD-ROM disk may contain packages that are not compatible with the distribution or may conflict with other packages. A retail store may not have the latest or the most suitable packages for the system. Reference:

NEW QUESTION # 28
Which of the following commands can be used to resolve a DNS name to an IP address?

- A. iplookup
- B. dns
- C. query
- D. host
- E. dnsname

Answer: D

Explanation:
The host command is used to resolve a DNS name to an IP address or vice versa. It can also perform other DNS queries, such as finding the mail servers for a domain. The host command has the following syntax: host [options] [name] [server]. The name argument can be a hostname, such as www.lpi.org, or an IP address, such as 192.168.0.1. The server argument is optional and specifies the name or IP address of the DNS server to query. If no server is given, the default system resolver is used. Reference:

NEW QUESTION # 29
Which of the following commands sets the variable USERNAME to the value bob?

- A. var USERNAME=bob
- B. set USERNAME bob
- C. USERNAME<=bob
- D. USERNAME=bob
- E. $USERNAME==bob

Answer: D

Explanation:
Explanation
The correct command to set the variable USERNAME to the value bob is USERNAME=bob. This command assigns the string bob to the variable name USERNAME, using the equal sign (=) as the assignment operator.
There is no space around the equal sign, and the variable name and value are case-sensitive. This command sets a shell variable, which is only valid in the current shell session. To make the variable an environment variable, which can be inherited by child processes and subshells, you need to use the export command, such as export USERNAME=bob. The other commands are not valid for setting variables in Linux. The set command is used to set or unset shell options and positional parameters, not variables. The $ sign is used to reference the value of a variable, not to assign it. The == sign is used for comparison, not assignment. The var keyword is not used in Linux, but in some other programming languages. The <= sign is used for redirection, not assignment.
