Pass Guaranteed Reliable C1000-200 - Test IBM MQ v9.4 Administrator - Professional Collection

The second form is IBM MQ v9.4 Administrator - Professional (C1000-200) web-based practice test which can be accessed through online browsing. The C1000-200 web-based practice test is supported by browsers like Firefox, Microsoft Edge, IBM Chrome, and Safari. You don't need to install any plugins or software to attempt the C1000-200 web-based practice test. This online IBM C1000-200 exam is also compatible with all operating systems.

IBM MQ v9.4 Administrator - Professional Sample Questions (Q32-Q37):

NEW QUESTION # 32

In IBM MQ, when multiple applications need to receive and process the same message independently without affecting each other's processing, which messaging pattern or configuration is most suitable to achieve this functionality efficiently?

- A. Clustered local queues with round-robin distribution
- B. Temporary queues for all subscribers
- C. Point-to-point messaging with a single shared queue
- D. Publish/Subscribe model with topics and subscriptions

Answer: D

Explanation:

The Publish/Subscribe model allows messages to be published to a topic, and each subscriber receives an independent copy, enabling multiple applications to process the same message without interference.

NEW QUESTION # 33

How does IBM MQ support the integration of messaging with external transaction managers, and what is the importance of

coordinating MQ transactions with other resource managers such as databases to maintain overall data consistency in distributed systems?

- A. MQ replicates messages to external systems without transactional guarantees, leaving consistency management to the application.
- B. MQ transactions are completely independent and cannot be coordinated with external databases, requiring manual reconciliation.
- C. MQ only supports transaction logging internally and does not interact with external systems.
- **D. MQ supports XA transactions, allowing it to participate in a distributed transaction with external resource managers so that message operations and database updates commit or rollback together, ensuring atomicity across systems.**

Answer: D

Explanation:

MQ's support for XA transactions allows coordinated commit or rollback with databases and other resources, ensuring that operations across systems remain consistent in distributed environments.

NEW QUESTION # 34

Which statement accurately describes how IBM MQ clustering can be used to achieve load balancing and high availability across multiple queue managers, including the concept of cluster repositories, cluster sender and receiver channels, and automatic workload distribution among member queue managers?

- A. Clustering is only used for backup purposes and does not affect message delivery
- B. Clustering only replicates queues but does not distribute workload
- **C. MQ clustering allows queues to be shared among multiple queue managers, with cluster repositories managing information and workload distributed automatically to available members**
- D. Clustered queue managers require manual intervention for message routing

Answer: C

Explanation:

IBM MQ clustering enables multiple queue managers to share queues. Cluster repositories maintain cluster information, and sender/receiver channels automatically route messages, balancing load and improving availability.

NEW QUESTION # 35

In a healthcare system where electronic health records are exchanged through IBM MQ, administrators need to guarantee that if a queue reaches its maximum depth, new incoming messages are either handled gracefully or redirected, instead of being discarded silently. Which IBM MQ configuration parameter or mechanism addresses this requirement?

- **A. Queue depth threshold events with alerting**
- B. Temporary queue allocation
- C. XA transaction rollback
- D. Dead-letter queue only

Answer: A

Explanation:

Queue depth threshold events allow MQ to alert or trigger actions when queue depth limits are reached, ensuring no silent message loss.

NEW QUESTION # 36

In scenarios where applications must be notified about changes in queue conditions, such as when a message arrives in an empty queue, which IBM MQ capability is used to automatically start a process or application in response to those queue events?

- **A. Triggering mechanisms defined on queues**
- B. Security exits applied to channels
- C. Logging subsystems that capture administrative events
- D. Non-persistent messaging with low overhead

Answer: A

Explanation:

Queue triggers allow IBM MQ to start an application automatically when defined conditions occur, such as the arrival of a message, enabling automation and responsiveness.

NEW QUESTION # 37
