PCEP Practice Tests | PCEP-30-02 exam questions

Question #1

Free PCEP (PCEP-30-02) Practice Mock Exam

Topic Section 3: Data Structures - Tuples, Dictionaries, Lists and Iterables

What is the output of the following code?

```
str = ***\nprint(len(str))
```

Select any one of given answer :

<input type="radio"/> Choice A	1
<input type="radio"/> Choice B	111111
<input type="radio"/> Choice C	11
<input type="radio"/> Choice D	111

Question #2

Free PCEP (PCEP-30-02) Practice Mock Exam

Topic Section 1: Common Programming and Python Fundamentals

What is the result of the following code?

BONUS!!! Download part of VCEPrep PCEP-30-02 dumps for free: [https://drive.google.com/open?id=1UR08NR1eKqwf\\_aVew47K599mgB7x3yhu](https://drive.google.com/open?id=1UR08NR1eKqwf_aVew47K599mgB7x3yhu)

Practice is one of the essential factors in passing the exam. To perform at their best on the real exam, candidates must use Python Institute PCEP-30-02 practice test material. To this end, PCEP-30-02 has developed three formats to help candidates prepare for their PCEP-30-02 exam: desktop-based practice test software, web-based practice test, and a PDF format.

We provide PCEP-30-02 Exam Torrent which are of high quality and can boost high passing rate and hit rate. Our passing rate is 99% and thus you can reassure yourself to buy our product and enjoy the benefits brought by our PCEP-30-02 exam materials. Our product is efficient and can help you master the PCEP - Certified Entry-Level Python Programmer guide torrent in a short time and save your energy. The product we provide is compiled by experts and approved by the professionals who boost profound experiences. It is revised and updated according to the change of the syllabus and the latest development situation in the theory and the practice.

## New Python Institute PCEP-30-02 Exam Fee - Valid PCEP-30-02 Study Notes

In modern society, we are busy every day. So the individual time is limited. The fact is that if you are determined to learn, nothing can stop you! You are lucky enough to come across our PCEP-30-02 exam materials. We can help you improve in the shortest time on the PCEP-30-02 exam. Even you do not know anything about the PCEP-30-02 Exam. It absolutely has no problem. You just need to accept about twenty to thirty hours' guidance, it is easy for you to take part in the exam. As you can see, our PCEP-30-02 practice exam will not occupy too much time.

## Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q22-Q27):

### NEW QUESTION # 22

A set of rules which defines the ways in which words can be coupled in sentences is called:

- A. lexis
- **B. syntax**
- C. semantics
- D. dictionary

**Answer: B**

Explanation:

Syntax is the branch of linguistics that studies the structure and rules of sentences in natural languages. Lexis is the vocabulary of a language. Semantics is the study of meaning in language. A dictionary is a collection of words and their definitions, synonyms, pronunciations, etc.

### NEW QUESTION # 23

What happens when the user runs the following code?

□

- A. The code enters an infinite loop.
- B. The code outputs 3.
- **C. The code outputs 2.**
- D. The code outputs 1.

**Answer: C**

Explanation:

The code snippet that you have sent is calculating the value of a variable "total" based on the values in the range of 0 to 3. The code is as follows:

```
total = 0
for i in range(0, 3):
    if i % 2 == 0:
        total = total + 1
    else:
        total = total + 2
print(total)
```

The code starts with assigning the value 0 to the variable "total". Then, it enters a for loop that iterates over the values 0, 1, and 2 (the range function excludes the upper bound). Inside the loop, the code checks if the current value of "i" is even or odd using the modulo operator (%). If "i" is even, the code adds 1 to the value of "total". If "i" is odd, the code adds 2 to the value of "total". The loop ends when "i" reaches 3, and the code prints the final value of "total" to the screen.

The code outputs 2 to the screen, because the value of "total" changes as follows:

- \* When i = 0, total = 0 + 1 = 1
- \* When i = 1, total = 1 + 2 = 3
- \* When i = 2, total = 3 + 1 = 4
- \* When i = 3, the loop ends and total = 4 is printed

Therefore, the correct answer is B. The code outputs 2.

### NEW QUESTION # 24

What is true about exceptions in Python? (Select two answers.)

- **A. Not more than one except branch can be executed inside one try-except block.**
- B. Python's philosophy encourages developers to make all possible efforts to protect the program from the occurrence of an exception.
- **C. According to Python terminology, exceptions are raised**
- D. According to Python terminology, exceptions are thrown

**Answer: A,C**

### NEW QUESTION # 25

What is the expected output of the following code?

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: C**

Explanation:

Explanation

The code snippet that you have sent is using the count method to count the number of occurrences of a value in a list. The code is as follows:

```
my_list = [1, 2, 3, 4, 5] print(my_list.count(1))
```

The code starts with creating a list called "my\_list" that contains the numbers 1, 2, 3, 4, and 5. Then, it uses the print function to display the result of calling the count method on the list with the argument 1. The count method is used to return the number of times a value appears in a list. For example, my\_list.count(1) returns 1, because 1 appears once in the list.

The expected output of the code is 1, because the code prints the number of occurrences of 1 in the list.

Therefore, the correct answer is D. 1.

## NEW QUESTION # 26

What is the expected result of running the following code?

- A. The code raises an unhandled exception.
- B. The code prints 2
- C. The code prints 1 .
- D. The code prints 0

**Answer: A**

Explanation:

The code snippet that you have sent is trying to use the index method to find the position of a value in a list.

The code is as follows:

```
the_list = [1, 2, 3, 4, 5] print(the_list.index(6))
```

The code starts with creating a list called "the\_list" that contains the numbers 1, 2, 3, 4, and 5. Then, it tries to print the result of calling the index method on the list with the argument 6. The index method is used to return the first occurrence of a value in a list.

For example, the\_list.index(1) returns 0, because 1 is the first value in the list.

However, the code has a problem. The problem is that the value 6 is not present in the list, so the index method cannot find it. This will cause a ValueError exception, which is an error that occurs when a function or operation receives an argument that has the right type but an inappropriate value. The code does not handle the exception, and therefore it will terminate with an error message.

The expected result of the code is an unhandled exception, because the code tries to find a value that does not exist in the list.

Therefore, the correct answer is C. The code raises an unhandled exception.
