Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q101-Q106):

NEW QUESTION # 101

What information is exchanged during a TCP three-way handshake? (Choose two)

- A. interfaces
- B. port numbers
- C. sequence numbers
- D. application name

Answer: B,C

Explanation:

The TCP three-way handshake establishes a reliable connection between two hosts. During this process:

* SYN: The client sends a TCP segment with the SYN flag set, including an initial sequence number (ISN) and port information.

* SYN-ACK: The server responds with a SYN-ACK, which contains its own sequence number and acknowledgment of the client's ISN.

* ACK: The client replies with an ACK, confirming receipt of the server's ISN.

Thus, port numbers (to identify the application endpoints) and sequence numbers (to ensure ordered and reliable data transfer) are exchanged.

Interfaces and application names are not exchanged during this process.

From Junos OS Fundamentals / TCP Concepts:

"The TCP three-way handshake establishes a reliable session by exchanging port numbers and sequence numbers between peers.

This process synchronizes both sides before data transmission begins." References:

NEW QUESTION # 102

What will the request system configuration rescue save command do?

- A. It activates the rescue configuration.
- B. It saves the candidate configuration as the rescue configuration.
- C. It saves a configuration version prior to the configuration most recently committed as the rescue configuration.
- D. It saves the most recently committed configuration as the rescue configuration.

Answer: D

Explanation:

The request system configuration rescue save command in Junos OS saves the most recently committed configuration as the rescue configuration. This rescue configuration can be used to recover the device if future configurations cause issues. It ensures there is a stable, known-good configuration to fall back on, which is crucial in network management and troubleshooting.

References:

* "rescue : save configurations as the rescue: request system configuration save(saves the current configs as a rescue configs)" from Useful Juniper Commands.txt.

NEW QUESTION # 103

What are two functions of the routing protocol daemon (rpd)? (Choose two.)

- A. It maintains routing tables.
- B. It generates chassis alarms.
- C. It provides access to the CLI.
- D. It creates forwarding tables.

Answer: A,D

Explanation:

The Routing Protocol Daemon (rpd) is a critical component in Juniper Networks devices, responsible for all routing operations. It maintains routing tables, which hold information about network paths and destinations derived from various routing protocols. These tables are used to make decisions about where to send packets. Additionally, rpd generates forwarding tables based on the information in the routing tables. The forwarding tables are then used by the Packet Forwarding Engine (PFE) to actually forward

packets to their next hop or final destination.

NEW QUESTION # 104

Which two statements are correct about Junos traceoptions? (Choose two.)

- A. Traceoptions are enabled by default.
- B. Traceoption output, by default, is stored in /var/iog/<file-name>.
- C. Traceoptions cannot be enabled in a production environment.
- D. Traceoptions are enabled through configuration.

Answer: B,D

Explanation:

Traceoptions in Junos OS are used for detailed debugging and troubleshooting of protocols and processes within the system. They are not enabled by default due to the potential performance impact and volume of data generated. Instead, traceoptions are enabled through specific configuration settings under the relevant protocol or process hierarchy. This allows administrators to target their troubleshooting efforts and control the scope of logging. By default, the output generated by traceoptions is stored in files located in the /var/log directory, with the file name typically specified in the traceoptions configuration. This structured approach to logging and debugging helps in diagnosing complex issues without overwhelming the system or the administrator with irrelevant data.

NEW QUESTION # 105

Which two statements are correct about Junos traceoptions? (Choose two.)

- A. Traceoptions are enabled by default.
- B. Traceoption output, by default, is stored in /var/iog/<file-name>.
- C. Traceoptions cannot be enabled in a production environment.
- D. Traceoptions are enabled through configuration.

Answer: B,D
