BCS ISTQB Certified Tester Foundation Level CTFL 4.0 Sample Questions (Q41-Q46):

NEW QUESTION # 41

Which of the following statements about the shift-left approach is true?

- A. Shift-left in testing can be implemented in several ways to find functional defects early in the lifecycle, but it cannot be relied upon to find defects associated with non-functional characteristics
- B. Shift-left in testing can be implemented only in Agile/DevOps frameworks, as it relies completely on automated testing activities performed within a continuous integration process
- C. Performance testing performed during component testing, is a form of shift-left in testing that avoids planning and executing costly end-to-end testing at the system test level in a production-like environment
- D. Continuous integration supports shift-left in testing as it can reduce the time between the introduction of a defect and its detection, thereby reducing the cost to fix it

Answer: D

Explanation:

This answer is correct because shift-left in testing is an approach that aims to perform testing activities as early as possible in the software development lifecycle, in order to find and fix defects faster and cheaper, and to improve the quality of the software product. Continuous integration is a practice that supports shift-left in testing, as it involves integrating and testing the software components frequently, usually several times a day, using automated tools and processes. Continuous integration can reduce the time between the introduction of a defect and its detection, thereby reducing the cost to fix it and the risk of accumulating defects that could affect the functionality or performance of the software product. NEW QUESTION # 42

Consider the following examples of risks identified in different software development projects:

- [I]. The contrast color ratio for both normal text and large text of a website does not comply with the applicable accessibility guidelines, making it difficult for many users to read the content on the pages
 - [II]. A development vendor fails to deliver their software system on time, causing significant delays to system integration testing activities that have been planned as part of a development project for a system of systems
 - [III]. People in the test team do not have sufficient skills to automate tests at the test levels required by the test automation strategy which does not allow production of an effective regression test suite
 - [IV]. In a web application, data from untrusted sources is not subject to proper input validation, making the application vulnerable to several security attacks
- Which of the following statements is true?

- A. [I] and [III] are product risks; [II] and [IV] are project risks
- B. [IV] is a product risk; [I], [II] and [III] are project risks
- C. [II], [III] and [IV] are product risks; [I] is a project risk
- D. [I] and [IV] are product risks. [II] and [III] are project risks

Answer: D

Explanation:

This answer is correct because product risks are risks that affect the quality of the software product, such as defects, failures, or non-compliance with requirements or standards. Project risks are risks that affect the project's schedule, budget, resources, or scope, such as delays, cost overruns, skill gaps, or scope changes. In this case, [I] and [IV] are product risks, as they relate to the accessibility and security of the software product, which are quality attributes. [II] and [III] are project risks, as they relate to the delivery time and the test automation skills of the test team, which are project factors. References: ISTQB Glossary of Testing Terms v4.

NEW QUESTION # 43

Consider the following user story and its acceptance criteria:

User Story:

As a member of the "Agnotoly" association, I want to be able to pay the association's dues through an automatic payment method so that I can forget about payment deadlines.

Acceptance Criteria:

- * The member can only pay with 'Agnesis Master' credit card.
- * The member must register their cell phone number.
- * The member must register the credit card in the payment system.
- * The member must select a payment method (monthly or annual).
- * The member must accept the terms and conditions for the selected method.
- * If terms and conditions are accepted, the system sends an OTP (one-time password) to the member's phone for verification.

- * The payment method is registered only after OTP verification.
 - * Once the payment method is registered, the system will charge on the first business day of the following month.
- Test Cycle Results:
- * Members successfully paid dues using the credit card.
 - * Payments were processed monthly and for over a year.

Which ONE of the following options identifies the acceptance criteria that has NOT been fully covered?

- A. Acceptance criteria 4 has not been fully covered during the above test cycle.
- B. All acceptance criteria have been fully covered during the above test cycle.
- C. Acceptance criteria 6 has not been fully covered during the above test cycle.
- **D. Acceptance criteria 8 has not been fully covered during the above test cycle.**

Answer: D

Explanation:

Comprehensive and Detailed In-Depth Explanation: Acceptance criteria 8 states that the system should charge the user on the first business day of the following month. However, the test cycle only verified monthly payments for over a year, without confirming whether payments were processed specifically on the first business day.

* (B) is incorrect because the test validated monthly and annual payment options.

* (C) is incorrect because not all criteria were fully validated.

* (D) is incorrect because OTP verification (6) was tested as part of registration.

Ensuring timely execution of payments (Criteria 8) requires additional validation.

NEW QUESTION # 44

Which ONE of the following options BEST describes a key characteristic of non-functional testing?

- **A. Performing non-functional testing starting at the system test level.**
- B. Limiting non-functional testing to security testing and performance testing only.
- C. Conducting non-functional testing exclusively at the acceptance test level.
- D. Ensuring non-functional testing focuses only on user experience and usability.

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation: Non-functional testing evaluates attributes like performance, security, and usability, which are typically assessed at the system test level or higher (A). It is not restricted to acceptance testing (B), goes beyond security and performance testing (C), and covers more than just user experience (D).

NEW QUESTION # 45

Which of the following statements best describe Behavior-Driven Development (BDD)?

- A. A psychological technique in which the team's behavior in agile teams is evaluated.
- B. Is used to develop code guided by automated test cases.
- C. Expresses the behavior of an application with test cases written in Given When Then format.
- **D. A collaborative approach that allows every stakeholder to contribute to how the software component must behave.**

Answer: D

Explanation:

Behavior-Driven Development (BDD) is a collaborative approach that enhances communication among project stakeholders, including developers, testers, and business analysts. It involves defining how software should behave through examples written in a common language understandable by all stakeholders, often using the Given-When-Then format.
