Reliable SCS-C03 - Test AWS Certified Security–Specialty Pdf

The features of the SCS-C03 dumps are quite obvious that it is based on the exam pattern. As per exam objective, it is designed for the convenience of the candidates. This content makes them expert with the help of the SCS-C03 practice exam. They can get SCS-C03 exam questions in these dumps. Old ways of teaching are not effective for SCS-C03 Exam Preparation. In this way students become careless. In our top SCS-C03 dumps these ways are discouraged. Now make the achievement of SCS-C03 certification easy by using these SCS-C03 exam questions dumps because the success is in your hands now.

Our online resources and events enable you to focus on learning just what you want on your timeframe. You get access to every SCS-C03 exams files and there continuously update our SCS-C03 Study Materials; these exam updates are supplied free of charge to our valued customers. Get the best SCS-C03 exam Training; as you study from our exam-files.

Lab SCS-C03 Questions - SCS-C03 Training Kit

We provide up-to-date AWS Certified Security – Specialty (SCS-C03) exam questions and study materials in three different formats. We have developed three variations of authentic SCS-C03 exam questions to cater to different learning preferences, ensuring that all candidates can effectively prepare for the SCS-C03 practice test. TrainingDumps offers SCS-C03 Practice Questions in PDF format, browser-based practice exams, and desktop practice test software. Each version of our updated SCS-C03 Questions has its own unique benefits, enabling you to confidently prepare for your certification test.

Amazon AWS Certified Security – Specialty Sample Questions (Q27-Q32):

NEW QUESTION # 27
A security engineer configured VPC Flow Logs to publish to Amazon CloudWatch Logs. After 10 minutes, no logs appear. The issue is isolated to the IAM role associated with VPC Flow Logs.
What could be the reason?

- A. logs:GetLogEvents is missing.
- B. The role cannot tag the log stream.

- C. The engineer cannot assume the role.
- D. The vpc-flow-logs.amazonaws.com principal cannot assume the role.

Answer: D

Explanation:
VPC Flow Logs require an IAM role that CloudWatch Logs can use to publish flow log records. AWS documentation and AWS Certified Security - Specialty materials explain that the VPC Flow Logs service must be able to assume the IAM role through its trust policy. The trust relationship must include the service principal vpc-flow-logs.amazonaws.com. If the trust policy does not allow this principal to assume the role, flow logs cannot be delivered and no records will appear in the CloudWatch Logs log group even when traffic exists. logs:GetLogEvents is not required for delivery; it is used for reading logs. The security engineer's ability to assume the role is not relevant because the service, not the engineer, assumes it. Tagging permissions are not required for basic log delivery. Therefore, the most likely cause is an incorrect trust policy that prevents the VPC Flow Logs service principal from assuming the role.

Amazon VPC Flow Logs IAM Role Requirements
IAM Trust Policies for AWS Services

NEW QUESTION # 28
A company sends Apache logs from EC2 Auto Scaling instances to a CloudWatch Logs log group with 1-year retention. A suspicious IP address appears in logs. A security engineer needs to analyze the past week of logs to count requests from that IP and list requested URLs.
What should the engineer do with the LEAST effort?

- A. Export to S3 and use AWS Glue.
- B. Use CloudWatch Logs Insights with queries.
- C. Stream to OpenSearch and analyze.
- D. Export to S3 and use Macie.

Answer: B

Explanation:
CloudWatch Logs Insights is a managed, on-demand query capability designed to search and analyze log data stored in CloudWatch Logs without moving the data elsewhere. AWS Certified Security - Specialty documentation highlights Logs Insights as the lowest-effort method for rapid investigations, because it supports filtering, parsing, aggregation, and time-range queries directly over existing log groups. In this scenario, the logs already exist in CloudWatch Logs with sufficient retention. The engineer can write a query that filters for the suspicious IP address, counts occurrences over the last 7 days, and extracts requested URLs using parsing functions. This satisfies both requirements (count and URLs) immediately, without building pipelines or exporting data. Option B adds operational overhead by provisioning and maintaining OpenSearch ingestion and indexing. Options A and D require exporting data and additional services that are not necessary for a one-week forensic query. Therefore, Logs Insights is the most efficient and cost-effective approach.

NEW QUESTION # 29
A company uses AWS IAM Identity Center to manage access to its AWS accounts. The accounts are in an organization in AWS Organizations. A security engineer needs to set up delegated administration of IAM Identity Center in the organization's management account.
Which combination of steps should the security engineer perform in IAM Identity Center before configuring delegated administration? (Select THREE.)

- A. Create permission sets for use only in the organization's management account.
- B. Create a new IAM Identity Center directory in the organization's management account.
- C. Create user assignments only in the organization's management account.
- D. Grant least privilege access to the organization's management account.
- E. Set up a second AWS Region in the organization's management account.
- F. Create IAM users for use only in the organization's management account.

Answer: A,B,C

Explanation:
AWS IAM Identity Center delegated administration requires foundational configuration to be completed in the organization's management account before delegation. According to the AWS Certified Security - Specialty documentation, IAM Identity Center must be enabled with a directory in the management account before any delegation can occur.
Permission sets must be created in the management account because they define the permissions that will later be delegated to member accounts. Additionally, user assignments must initially exist in the management account to establish baseline access control before delegation is configured.
Option A is too generic and not a required prerequisite step. Option C is unrelated to Identity Center delegation. Option E is incorrect because IAM Identity Center uses identities from its directory or external IdPs, not IAM users.
AWS guidance clearly outlines directory creation, permission set definition, and initial user assignments as mandatory preparatory steps for delegated administration.

NEW QUESTION # 30
A company is implementing new compliance requirements to meet customer needs. According to the new requirements, the company must not use any Amazon RDS DB instances or DB clusters that lack encryption of the underlying storage. The company needs a solution that will generate an email alert when an unencrypted DB instance or DB cluster is created. The solution also must terminate the unencrypted DB instance or DB cluster.
Which solution will meet these requirements in the MOST operationally efficient manner?

- A. Create an Amazon EventBridge rule that evaluates RDS event patterns and is initiated by the creation of DB instances or DB clusters. Configure the rule to invoke an AWS Lambda function. Configure the Lambda function to publish messages to an Amazon Simple Notification Service (Amazon SNS) topic and to delete the unencrypted resource.
- B. Create an Amazon EventBridge rule that evaluates RDS event patterns and is initiated by the creation of DB instances or DB clusters. Configure the rule to publish messages to an Amazon Simple Notification Service (Amazon SNS) topic that includes an AWS Lambda function and an email delivery target as subscribers. Configure the Lambda function to delete the unencrypted resource.
- C. Create an AWS Config managed rule to detect unencrypted RDS storage. Configure a manual remediation action to invoke an AWS Lambda function. Configure the Lambda function to publish messages to an Amazon Simple Notification Service (Amazon SNS) topic and to delete the unencrypted resource.
- D. Create an AWS Config managed rule to detect unencrypted RDS storage. Configure an automatic remediation action to publish messages to an Amazon Simple Notification Service (Amazon SNS) topic that includes an AWS Lambda function and an email delivery target as subscribers. Configure the Lambda function to delete the unencrypted resource.

Answer: D

Explanation:
AWS Config provides managed rules that continuously evaluate resource configurations against compliance requirements. The AWS Certified Security - Specialty documentation highlights AWS Config managed rules as the preferred mechanism for enforcing configuration compliance at scale. The managed rule for encrypted RDS storage automatically detects DB instances and clusters that are created without encryption enabled.
By configuring automatic remediation, AWS Config can immediately invoke corrective actions without manual intervention. Integrating remediation with an Amazon SNS topic enables automated email notifications, while an AWS Lambda function can terminate the noncompliant resource. This creates a fully automated detect-alert-remediate workflow.
Option B requires manual remediation, which increases operational effort and delays enforcement. Options C and D rely on Amazon EventBridge, which evaluates events rather than configuration state and does not provide continuous compliance monitoring. AWS Config is explicitly designed for configuration compliance and governance use cases.
This solution aligns with AWS governance best practices by combining continuous monitoring, automated remediation, and centralized alerting with minimal operational overhead.

AWS Config Automatic Remediation

NEW QUESTION # 31

A company has a single AWS account and uses an Amazon EC2 instance to test application code. The company recently discovered that the instance was compromised and was serving malware. Analysis showed that the instance was compromised 35 days ago. A security engineer must implement a continuous monitoring solution that automatically notifies the security team by email for high severity findings as soon as possible.

Which combination of steps should the security engineer take to meet these requirements? (Select THREE.)

- A. Create an Amazon Simple Queue Service (Amazon SQS) queue. Subscribe the security team's email distribution list to the queue.
- B. Create an Amazon EventBridge rule for Security Hub findings of high severity. Configure the rule to publish a message to the queue.
- C. Enable AWS Security Hub in the AWS account.
- D. Create an Amazon Simple Notification Service (Amazon SNS) topic. Subscribe the security team's email distribution list to the topic.
- E. Enable Amazon GuardDuty in the AWS account.
- F. Create an Amazon EventBridge rule for GuardDuty findings of high severity. Configure the rule to publish a message to the topic.

Answer: D,E,F

Explanation:

Amazon GuardDuty provides continuous threat detection for compromised instances by analyzing VPC Flow Logs, DNS logs, and CloudTrail events. According to AWS Certified Security - Specialty guidance, GuardDuty is the fastest service to enable for detecting malware and compromised EC2 instances.

To notify the security team, Amazon SNS provides a native email notification mechanism with minimal setup. Amazon EventBridge integrates directly with GuardDuty findings and can filter based on severity.

Creating an EventBridge rule that matches high severity GuardDuty findings and publishes to SNS ensures immediate notification. Security Hub is not required for this use case and adds additional setup time. Amazon SQS does not support email subscriptions.
