## CompTIA Security+ Certification Exam Sample Questions (Q709-Q714):

### NEW QUESTION # 709

After a security awareness training session, a user called the IT help desk and reported a suspicious call. The suspicious caller stated that the Chief Financial Officer wanted credit card information in order to close an invoice. Which of the following topics did the user recognize from the training?

- A. Executive whaling
- B. Social engineering
- C. Email phishing
- D. Insider threat

**Answer: B**

Explanation:

Social engineering is the practice of manipulating people into performing actions or divulging confidential information, often by impersonating someone else or creating a sense of urgency or trust. The suspicious caller in this scenario was trying to use social engineering to trick the user into giving away credit card information by pretending to be the CFO and asking for a payment. The user recognized this as a potential scam and reported it to the IT help desk. The other topics are not relevant to this situation. #### NEW QUESTION # 710

An employee used a company's billing system to issue fraudulent checks. The administrator is looking for evidence of other occurrences of this activity. Which of the following should the administrator examine?

- A. Application logs
- B. Firewall logs
- C. IDS/IPS logs
- D. Vulnerability scanner logs

**Answer: A**

#### NEW QUESTION # 711

A Chief Information Security Officer wants to monitor the company's servers for SQLi attacks and allow for comprehensive investigations if an attack occurs. The company uses SSL decryption to allow traffic monitoring. Which of the following strategies would best accomplish this goal?

- A. Deploying network traffic sensors on the same subnet as the servers
- B. Logging all NetFlow traffic into a SIEM
- C. Logging endpoint and OS-specific security logs
- D. Enabling full packet capture for traffic entering and exiting the servers

**Answer: D**

Explanation:

Full packet capture is a technique that records all network traffic passing through a device, such as a router or firewall. It allows for detailed analysis and investigation of network events, such as SQLi attacks, by providing the complete content and context of the packets. Full packet capture can help identify the source, destination, payload, and timing of an SQLi attack, as well as the impact on the server and database. Logging NetFlow traffic, network traffic sensors, and endpoint and OS-specific security logs can provide some information about network activity, but they do not capture the full content of the packets, which may limit the scope and depth of the investigation. #### NEW QUESTION # 712

A company is concerned about weather events causing damage to the server room and downtime. Which of the following should the company consider?

- A. Geographic dispersion
- B. Load balancers
- C. Clustering servers
- D. Off-site backups

**Answer: A**

Explanation:

Geographic dispersion is a strategy that involves distributing the servers or data centers across different geographic locations. Geographic dispersion can help the company to mitigate the risk of weather events causing damage to the server room and downtime, as well as improve the availability, performance, and resilience of the network. Geographic dispersion can also enhance the disaster recovery and business continuity capabilities of the company, as it can provide backup and failover options in case of a regional outage or disruption<sup>12</sup>.

The other options are not the best ways to address the company's concern:

Clustering servers: This is a technique that involves grouping multiple servers together to act as a single system. Clustering servers can help to improve the performance, scalability, and fault tolerance of the network, but it does not protect the servers from physical damage or downtime caused by weather events, especially if the servers are located in the same room or building<sup>3</sup>.

Load balancers: These are devices or software that distribute the network traffic or workload among multiple servers or resources. Load balancers can help to optimize the utilization, efficiency, and reliability of the network, but they do not prevent the servers from being damaged or disrupted by weather events, especially if the servers are located in the same room or building<sup>4</sup>.

Off-site backups: These are copies of data or files that are stored in a different location than the original source. Off-site backups can help to protect the data from being lost or corrupted by weather events, but they do not prevent the servers from being damaged or disrupted by weather events, nor do they ensure the availability or continuity of the network services.

### NEW QUESTION # 713

A company hired a security manager from outside the organization to lead security operations. Which of the following actions should the security manager perform first in this new role?

- A. Establish a security baseline.
- B. Perform a user ID revalidation.
- **C. Review security policies.**
- D. Adopt security benchmarks.

**Answer: C**

Explanation:

When a security manager is hired from outside the organization to lead security operations, the first action should be to review the existing security policies. Understanding the current security policies provides a foundation for identifying strengths, weaknesses, and areas that require improvement, ensuring that the security program aligns with the organization's goals and regulatory requirements. Review security policies: Provides a comprehensive understanding of the existing security framework, helping the new manager to identify gaps and areas for enhancement.

Establish a security baseline: Important but should be based on a thorough understanding of existing policies and practices.

Adopt security benchmarks: Useful for setting standards, but reviewing current policies is a necessary precursor.

Perform a user ID revalidation: Important for ensuring user access is appropriate but not the first step in understanding overall security operations.
