## CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q320-Q325):

### NEW QUESTION # 320

Which of the following evidence collection methods is most likely to be acceptable in court cases?

- A. Providing a full system backup inventory
- B. Copying all access files at the time of the incident
- **C. Providing a bit-level image of the hard drive**
- D. Creating a file-level archive of all files

**Answer: C**

Explanation:

A bit-level image is a forensic-grade copy that preserves all data on a disk, including unallocated space, deleted files, and metadata. This is the most legally defensible form of digital evidence collection, as it ensures that no potential evidence is missed.

### NEW QUESTION # 321

A company is implementing a vulnerability management program and moving from an on-premises environment to a hybrid IaaS cloud environment. Which of the following implications should be considered on the new hybrid environment?

- A. The current scanners should be migrated to the cloud
- **B. Cloud-specific misconfigurations may not be detected by the current scanners**
- C. Existing vulnerability scanners cannot scan IaaS systems
- D. Vulnerability scans on cloud environments should be performed from the cloud

**Answer: B**

Explanation:

Cloud-specific misconfigurations are security issues that arise from improper or inadequate configuration of cloud resources, such as storage buckets, databases, virtual machines, or containers. Cloud-specific misconfigurations may not be detected by the current scanners that are designed for on-premises environments, as they may not have the visibility or access to the cloud resources or the cloud provider's APIs. Therefore, one of the implications that should be considered on the new hybrid environment is that cloud-specific misconfigurations may not be detected by the current scanners.

### NEW QUESTION # 322

While reviewing web server logs, a security analyst discovers the following suspicious line:

Which of the following is being attempted?

- **A. Command injection**
- B. Remote file inclusion
- C. Server-side request forgery
- D. Reverse shell

**Answer: A**

Explanation:

The suspicious line in the web server logs is an attempt to execute a command on the server, indicating a command injection attack. References: CompTIA CySA+ Study Guide: Exam CS0-003, 3rd Edition, Chapter 5, page 197; CompTIA CySA+ CS0-003 Certification Study Guide, Chapter 5, page 205.

### NEW QUESTION # 323

Which of the following risk management principles is accomplished by purchasing cyber insurance?

- A. Mitigate
- B. Accept
- **C. Transfer**
- D. Avoid

**Answer: C**

Explanation:

Transfer is the risk management principle that is accomplished by purchasing cyber insurance. Transfer is a strategy that involves shifting the risk or its consequences to another party, such as an insurance company, a vendor, or a partner. Transfer does not eliminate the risk, but it reduces the potential impact or liability of the risk for the original party. Cyber insurance is a type of insurance that covers the losses and damages resulting from cyberattacks, such as data breaches, ransomware, denial-of-service attacks, or network disruptions. Cyber insurance can help transfer the risk of cyber incidents by providing financial compensation, legal assistance, or recovery services to the insured party. Official References:

### NEW QUESTION # 324

Which of the following is described as a method of enforcing a security policy between cloud customers and cloud services?

- A. SIEM
- B. DMARC
- **C. CASB**
- D. PAM

**Answer: C**

Explanation:

Explanation

A CASB (Cloud Access Security Broker) is a security solution that acts as an intermediary between cloud users and cloud providers, and monitors and enforces security policies for cloud access and usage. A CASB can help organizations protect their data and applications in the cloud from unauthorized or malicious access, as well as comply with regulatory standards and best practices. A CASB can also provide visibility, control, and analytics for cloud activity, and identify and mitigate potential threats<sup>12</sup>. The other options are not correct. DMARC (Domain-based Message Authentication, Reporting and Conformance) is an email authentication protocol that helps email domain owners prevent spoofing and phishing attacks by verifying the sender's identity and instructing the receiver how to handle unauthenticated messages<sup>34</sup>. SIEM (Security Information and Event Management) is a security solution that collects, aggregates, and analyzes log data from various sources across an organization's network, such as applications, devices, servers, and users, and provides real-time alerts, dashboards, reports, and incident response capabilities to help security teams identify and mitigate cyberattacks<sup>56</sup>. PAM (Privileged Access Management) is a security solution that helps organizations manage and protect the access and permissions of users, accounts, processes, and systems that have elevated or administrative privileges. PAM can help prevent credential theft, data breaches, insider threats, and compliance violations by monitoring, detecting, and preventing unauthorized privileged access to critical resources<sup>78</sup>.
