- B. The period between the discovery of a vulnerability and development and release of a patch
- C. A specific day during which zero threats occurred
- D. The day a software vendor becomes aware of an exploit and prevents any further hacking

Answer: B

Explanation:
A zero-day threat is an attack that takes advantage of a security vulnerability that does not have a fix in place. It is referred to as a "zero-day" threat because once the flaw is eventually discovered, the developer or organization has "zero days" to then come up with a solution. A zero-day threat can compromise a system or network by exploiting the unknown vulnerability, and can cause data loss, unauthorized access, or other damages. Zero-day threats are difficult to detect and prevent, and require advanced security solutions and practices to mitigate them. Reference:
