NETA Level 2 Certified Assistant Electrical Testing Specialist Sample Questions (Q92-Q97):

NEW QUESTION # 92

A tagout device must be able to withstand a minimum pull force of:

- A. 50 lb
- B. 75 lb
- C. 25 lb
- D. 30 lb

Answer: A

Explanation:

Tagout devices are required to be durable enough to remain attached and legible under typical industrial conditions. A common OSHA-based minimum strength requirement cited in training and field practice is that tagout devices must withstand at least 50 pounds of force to prevent accidental detachment or removal.

NETA Level 2 objectives reinforce that LOTO is not paperwork—it is a physical hazard control program.

Tags must be secured using non-reusable, self-locking means such as a nylon cable tie that meets strength requirements. If a tag can be easily pulled off, it fails as a control measure and increases the likelihood of unauthorized operation.

Even though tagout does not physically prevent operation like lockout, it still must provide reliable warning and procedural control.

Ensuring tag integrity is part of the technician's responsibility when applying or verifying hazardous energy control practices before testing or commissioning.

NEW QUESTION # 93

When personnel are working in a permitted confined space, how many attendants must remain outside the space and for how long?

- A. Two attendants, until entry permit expires
- B. One attendant, during entry only
- C. One attendant, for the duration of the operation
- D. Two attendants, during energized work

Answer: C

Explanation:

Confined space safety requirements mandate that at least one trained attendant remain outside the space for the entire duration of the entry operation. The attendant monitors conditions, maintains communication, and initiates rescue procedures if needed. NETA Level 2 technicians must comply with confined space protocols when testing transformers, vaults, or enclosed switchgear compartments.

NEW QUESTION # 94

The sum of all voltage drops around a series circuit is:

- A. Zero
- B. Dependent on resistance values
- C. Greater than the applied voltage
- D. Equal to the applied voltage

Answer: D

Explanation:

Kirchhoff's Voltage Law states that the algebraic sum of voltages around any closed loop equals the applied voltage. This principle underpins circuit analysis and is essential for verifying expected readings during troubleshooting and commissioning.

NEW QUESTION # 95

Which ANSI device number corresponds to an undervoltage relay?

- A. 0
- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

ANSI device 27 designates an undervoltage relay. This relay operates when system voltage falls below a preset threshold and is commonly used for motor protection, load shedding, and system interlocking. NETA Level 2 technicians must recognize ANSI device numbers to correctly identify protective functions during testing, troubleshooting, and commissioning.

NEW QUESTION # 96

Sample valves should be flushed with at least how much waste liquid before collecting a transformer oil sample?

- A. One pint
- B. One gallon
- C. Until temperature stabilizes
- **D. One quart**

Answer: D

Explanation:

NETA-recommended oil sampling practices require flushing the sampling valve with at least one quart of waste liquid. This removes stagnant oil, debris, and contaminants that could skew test results.

Accurate oil analysis depends heavily on proper sampling technique. NETA Level 2 technicians must follow flushing and cleanliness requirements to ensure valid dielectric and moisture analysis.
