## Salesforce Certified MuleSoft Associate Sample Questions (Q32-Q37):

### NEW QUESTION # 32

An integration team follows MuleSoft's recommended approach to full lifecycle API development. Which activity should this team perform during the API implementation phase?

- A. Use the API specification to build the MuleSoft application
- B. Use the API specification to monitor the MuleSoft application
- C. Design the API specification
- D. Validate the API specification

**Answer: A**

Explanation:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation, testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

API Design:

Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

API Implementation:

Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.

APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.

Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.

Validation and Monitoring:

Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.

Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.

MuleSoft Documentation: Full Lifecycle API Management

APIKit: Building APIs with APIKit

### NEW QUESTION # 33

Which Anypoint Platform component should a MuleSoft developer use to create an API specification prior to building the API implementation?

- **A. API Designer**
- B. Runtime Manager
- C. MUnit
- D. API Manager

**Answer: A**

Explanation:

Creating an API specification before building the API implementation is a critical step in API development. MuleSoft's API Designer is the tool designed for this purpose. Here's a detailed explanation:

API Designer:

Purpose: API Designer is a web-based tool within Anypoint Platform that allows developers to design, document, and test APIs.

Features:

Specification Languages: Supports RAML and OAS (OpenAPI Specification) for defining APIs.

Interactive Editing: Provides a graphical and text-based interface to design API specifications interactively.

Mocking Service: Allows developers to create mock services to simulate API behavior before the actual implementation.

Process:

Define API: Use API Designer to create a detailed API specification, including endpoints, methods, request/response schemas, and security schemes.

Documentation: Automatically generate API documentation that can be shared with stakeholders.

Testing: Test the API design using the built-in mocking service to ensure it meets requirements.

MuleSoft Documentation: API Designer

API Design Best Practices: Designing APIs

### NEW QUESTION # 34

According to MuleSoft what is a major distinguishing characteristic of an application network in relation to the integration of systems, data, and devices?

- A. It uses CI/CD automation for real-time project delivery
- B. It uses a well-organized monolithic approach with standards
- C. It leverages well-accepted internet standards like HTTP and JSON
- **D. It is built for change and self-service**

**Answer: D**

**Explanation:**

An application network, as envisioned by MuleSoft, is designed to be dynamic and self-service, enabling rapid adaptation to changing business needs. Here's a detailed explanation:

Which Exchange asset type represents a complete API specification in RAML or OAS format?

- **A. REST APIs**
- B. API Spec Fragments
- C. SOAP APIs
- D. Connectors

**Answer: A**

**Explanation:**

In Anypoint Exchange, a REST API asset represents a complete API specification in RAML (RESTful API Modeling Language) or OAS (OpenAPI Specification) format. Here's a detailed explanation:

**REST APIs:**

**Definition:** REST APIs are application programming interfaces that adhere to the principles of REST, allowing interaction with RESTful web services.

**Specifications:** Typically defined using RAML or OAS to describe the API's endpoints, methods, request/response structures, and security protocols.
