NEW QUESTION # 188

What is one method for reducing queue length?

- A. Leave capacity for newly emerging priorities
- **B. Resize the work**
- C. Lengthen Iteration timeboxes
- D. Commit to deliver value by a specific date

Answer: B

Explanation:

Resizing the work is one method for reducing queue length in SAFe. Queue length is the number of work items waiting to be processed in a system. Reducing queue length can improve flow, reduce cycle time, and increase throughput. Resizing the work means breaking down large work items into smaller ones that can be completed faster and with less variability. Smaller work items also reduce the risk of rework, defects, and delays. Resizing the work can be done at any level of SAFe, from portfolio epics to team stories. SAFe provides several techniques for resizing the work, such as Weighted Shortest Job First (WSJF), Minimum Marketable Features (MMFs), Minimum Viable Products (MVPs), and Spikes¹. - B. It builds long-term partnerships based on trust

- B. It identifies possible constraints for Solution completion
- C. It helps analyze, approve, and track Portfolio Epics and Enablers
- **D. It encourages collaboration and enables flow**

Answer: D

According to the SAFe for Teams SP (6.0) - SAFe Practitioner handbook and study guide, a work in process (WIP) constraint is a limit on the amount of work that can be done at any stage of the value stream. The purpose of a WIP constraint is to reduce the batch size, manage the queue length, and improve the flow of value. By limiting the WIP, teams can focus on completing the most important work items, collaborate more effectively, and deliver value faster and more frequently. A WIP constraint also helps teams identify and resolve bottlenecks, reduce waste, and increase quality.
