Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q157-Q162):

NEW QUESTION # 157

Why is governance crucial in balancing the speed of adoption with risk control in cybersecurity initiatives?

- A. Speeds up project execution irrespective of and focuses on systemic risk
- B. Ensures alignment between global compliance standards
- C. Ensures adequate risk management while allowing innovation
- D. Only involves senior management in decision-making

Answer: C

Explanation:

Governance in cybersecurity is crucial because it provides the framework to ensure that security risks are adequately managed while still allowing the organization to adopt new technologies and innovations at a reasonable pace. Effective governance helps organizations balance the need for security controls with the need for agility and speed in adopting new solutions. It ensures that risks are identified, assessed, and mitigated without unnecessarily slowing down progress or stifling innovation.

Without governance, there is a risk that security concerns may be overlooked, or too many restrictions might be placed on adoption, leading to delays or failure to innovate. Proper governance strikes the right balance between security and agility.

NEW QUESTION # 158

Which of the following is most commonly used to program Application Programming Interface(API)?

- A. JSON
- B. SOAP
- C. REST
- D. HTTP

Answer: C

Explanation:

APIs are typically REST for cloud services, since REST is easy to implement across the Internet. REST APIs have become the standard for web-based services since they run over HTTP and thus work well across diverse environments.

NEW QUESTION # 159

The ability of a cloud services datacentre and its associated components, including servers, storage, and so on, to continue operating in the event of a disruption, which may be equipment failure, power outage, or a natural disaster, known as:

- A. Disaster recovery
- B. Redundancy
- C. Continuity
- D. Resiliency

Answer: D

Explanation:

Resiliency is the correct answer but other options look very similar and is provided to create confusion.

One need to be careful while answering the question.

Resiliency is often confused with redundancy, Key difference is

A redundant system includes multiple channels to provide alternate paths for communications in case of individual failures.

... Resilience, on the other hand, refers to a system's ability to adapt to failures and to resume normal operations when the failure has been resolved.

NEW QUESTION # 160

Which approach is essential in identifying compromised identities in cloud environments where attackers utilize automated methods?

- A. Deploying behavioral detectors for IAM and management plane activities
- B. Relying on IP address and connection header monitoring
- C. Implementing full packet capture and monitoring
- D. Focusing exclusively on signature-based detection for known malware

Answer: A

Explanation:

Behavioral detection for IAM and management plane activities is essential for identifying unusual or suspicious actions by compromised identities, especially in environments where attackers use automated tactics. Reference: [CCSK v5 Curriculum, Domain 5 - IAM]

NEW QUESTION # 161

Which of the following is a common risk factor related to misconfiguration and inadequate change control in cybersecurity?

- A. Excessive SBOM focus
- B. Lack of sensitive data encryption
- C. Lack of 3rd party service provider specialized in patch management procedures

- D. Failure to update access controls after employee role changes

Answer: D

Explanation:

Correct Option: A. Failure to update access controls after employee role changes This falls under one of the most common risk factors related to cloud misconfiguration and poor change management. Misconfiguration errors often stem from insufficient change control, especially in dynamic environments like the cloud. According to CSA's Security Guidance v4.0, poor governance of identity and access management (IAM) changes - such as not updating access privileges when user roles change - introduces serious security risks.

"Cloud computing is dynamic by nature. This places more importance on automation and proper governance, especially for identity and access control. Failure to remove or update access permissions after personnel changes leads to orphaned or over-permissioned accounts, which are prime targets for attackers."

- Domain 2: Governance and Enterprise Risk Management, CSA Security Guidance v4.0 Also highlighted in ENISA's Cloud Risk Assessment:

"Loss of governance includes failing to maintain proper control over access privileges and role assignments. Poor change management and inadequate configuration reviews can leave systems open to unauthorized access."

- ENISA Cloud Computing Risk Assessment, Section R.2: Loss of Governance Why the Other Options Are Incorrect:

B . Lack of sensitive data encryption: While encryption is critical, it is not directly tied to change control or misconfiguration, but rather falls under Data Security and Encryption domain.

C . Lack of 3rd party service provider specialized in patch management procedures: This refers more to vendor management and Security-as-a-Service, not internal change control or misconfigurations.

D . Excessive SBOM focus: Software Bill of Materials (SBOM) is important for supply chain transparency, but excessive focus on it isn't a typical misconfiguration or change control risk.
