## IdentityIQ-Associate試験の準備方法 | 有難いIdentityIQ-Associate赤本勉強試験 | 素敵なSailPoint Certified IdentityIQ Associate Exam受験対策

JPTestKingは専門的な、受験生の皆さんを対象とした最も先進的なSailPointのIdentityIQ-Associate試験の認証資料を提供しているサイトです。JPTestKingを利用したら、SailPointのIdentityIQ-Associate試験に合格するのを心配することはないです。

### SailPoint Certified IdentityIQ Associate Exam 認定 IdentityIQ-Associate 試験問題 (Q26-Q31):

#### 質問 # 26

Is this statement true about attributes in IdentityIQ?

The value for a specific account attribute can be sourced from several applications.

- A. No
- B. Yes

正解: A

解説:

The statement is false. In IdentityIQ, an account attribute is defined within a specific application account schema and represents data stored on an account link for that application. Its value is obtained from the account data aggregated from that particular application connector. For example, an account attribute such as memberOf, department, title, or accountStatus belongs to the account schema of a defined application and is populated from that application's aggregation results.

The concept of sourcing values from several applications applies more directly to identity attributes, not account attributes. Identity

attributes reside on the IdentityCube and may be derived from authoritative sources, account links, rules, mappings, or precedence logic across multiple applications. IdentityIQ uses identity attribute configuration to normalize data such as department, location, manager, email, or lifecycle state at the identity level.

Therefore, while multiple applications may contain similarly named account attributes, each account attribute value is tied to its own application account schema and account link. It is not a single shared account attribute sourced from several applications.

Reference topics: Applications - account schema attributes; Identity Modeling - identity attributes versus account attributes; Identity Refresh - updating IdentityCube attributes.

#### 質問 # 27

Is this displayed in the Identity Warehouse?

Entitlements (identity's permissions on native applications)

- A. No
- **B. Yes**

正解: B

解説:

Yes. In SailPoint IdentityIQ, the Identity Warehouse presents identity-centered information collected and modeled inside the IdentityCube. Entitlements are part of that identity view because they represent the user's permissions or access rights on connected applications. During aggregation, IdentityIQ reads account data from applications, including entitlement-bearing attributes such as groups, roles, permissions, or other managed access values. These are stored on the identity's application accounts and surfaced in the Identity Warehouse so reviewers, administrators, and governance users can understand what access the identity currently has. This is distinct from identity attributes such as department, manager, location, or lifecycle state. Entitlements describe access on target systems and are central to access reviews, policy evaluation, role modeling, and access request decisions. Displaying entitlements in the Identity Warehouse allows IdentityIQ to provide a complete access profile for the identity, including accounts, assigned roles, detected roles, policy violations, and application permissions.

Therefore, entitlements are displayed as part of the Identity Warehouse identity details. Reference topics:

Identity Modeling, IdentityCube contents, Identity Warehouse, application accounts, entitlement aggregation, managed attributes, and access visibility.

#### 質問 # 28

Is this statement true for the identity refresh task?

It references the application definitions to determine how to connect to the native systems.

- **A. No**
- B. Yes

正解: A

解説:

The statement is false. The Identity Refresh task does not use application definitions to determine how to connect to native target systems. That function belongs to application aggregation and connector-based operations. In IdentityIQ, an application definition contains the connector configuration, schemas, correlation settings, aggregation options, and provisioning-related settings required for IdentityIQ to communicate with a managed system.

The Identity Refresh task operates primarily on identity data already present inside IdentityIQ. It updates IdentityCubes by recalculating identity attributes, refreshing role assignments and detections, evaluating policies, processing lifecycle events, updating manager relationships, and applying selected identity model calculations. It is typically run after aggregation or configuration changes so that identity-level governance data reflects current account and entitlement information.

Therefore, connecting to native systems is not the purpose of Identity Refresh. IdentityIQ connects to native systems through aggregation tasks or provisioning operations that reference the application definitions and connectors. Identity Refresh consumes the resulting identity, account, entitlement, and application link data within the IdentityIQ repository.

Reference topics: Identity Modeling - Identity Refresh options; Applications - application definitions and connector settings; Foundational Concepts - tasks versus workflows; Provisioning - connector-based fulfillment.

#### 質問 # 29

Is this statement true about managers in IdentityIQ?

References to an identity's manager must be provided in the authoritative application.

- A. No
- **B. Yes**

**正解: B**

解説:

The statement is true in the context of IdentityIQ manager correlation. IdentityIQ does not infer an identity's manager relationship without source data that identifies the manager. The authoritative application, typically an HR or personnel source, provides the trusted identity records and should include a manager reference attribute, such as manager ID, employee number, username, distinguished name, or another value that can be correlated to an existing IdentityIQ identity.

During aggregation and identity refresh, IdentityIQ uses configured manager correlation logic to resolve that manager reference to an IdentityCube representing the manager. Once resolved, the manager relationship can support governance functions such as manager certifications, access request approvals, lifecycle approvals, escalations, and reporting hierarchy-based controls. Without a manager reference from the authoritative source, IdentityIQ may still contain identities, accounts, and access, but it cannot reliably establish reporting relationships for those identities through standard manager correlation.

This is distinct from manually assigning relationships or using custom logic; the standard governance model expects manager data to originate from the authoritative identity source. Reference topics: Identity Modeling

- manager correlation, IdentityCube attributes, authoritative identity data; Governance - manager-based certifications and approvals; User-Driven Requests - manager approval routing.

**質問 # 30**

Why would an organization define lifecycle events in IdentityIQ?

To define what should trigger a joiner process, a mover process, or a leaver process

- A. No
- **B. Yes**

**正解: B**

解説:

Yes. Lifecycle Events in SailPoint IdentityIQ are defined to detect significant identity changes and trigger the appropriate business process in response. Organizations commonly use them to automate joiner, mover, and leaver scenarios. A joiner event may be triggered when a new identity is created or becomes active. A mover event may be triggered by changes such as department, job title, manager, location, or business unit. A leaver event may be triggered when an identity's employment status or lifecycle state indicates termination.

The lifecycle event configuration defines the condition to monitor and the business process or workflow to execute when that condition is met. This allows IdentityIQ to automate access provisioning, role assignment, account creation, access removal, account disablement, approvals, notifications, and other lifecycle-driven actions.

Therefore, the statement is accurate. Lifecycle Events are specifically used to define what identity data changes should initiate joiner, mover, or leaver processing.

Reference topics: Provisioning, Lifecycle Events, joiner-mover-leaver processing, identity attribute changes, business processes, workflows, and event-driven provisioning.

**質問 # 31**

.....

すべての働く人は、IdentityIQ-Associateがこの分野で支配的な人物であり、また彼らのキャリアに役立つことを知っています。IdentityIQ-Associate信頼性の高い試験ブートキャンプが試験に合格し、資格証明書を取得するのに役立つ場合、より良いキャリア、より良い人生を得ることができます。私たちの研究IdentityIQ-Associateガイド資料は、最新のIdentityIQ-Associateテストの質問と回答のほとんどを網羅しています。確かにこの分野で何か違うことをしようと決心しているなら、役に立つ認定はあなたのキャリアの足がかりになるでしょう。
