As we all know, a lot of efforts need to be made to develop a COF-C03 learning prep. Firstly, a huge amount of first hand materials are essential, which influences the quality of the compilation about the COF-C03 actual test guide. We have tried our best to find all reference books. Then our experts have carefully summarized all relevant materials of the COF-C03 exam. Also, annual official test is also included. They have built a clear knowledge frame in their minds before they begin to compile the COF-C03 Actual Test guide. It is a long process to compilation. But they stick to work hard and never abandon. Finally, they finish all the compilation because of their passionate and persistent spirits. So you are lucky to come across our COF-C03 exam questions.

Snowflake COF-C03 Exam Syllabus Topics:

Section	Weight	Objectives
Topic 1: Data Collaboration & Protection	10%	- Data Protection, Retention, Time Travel, Fail-safe - Secure Data Sharing, Listings, Marketplace - Data Clean Rooms, Collaboration Features
Topic 2: Account Management & Data Governance	20%	- Trust Center, Data Lineage, Compliance - Security: Network Policies, MFA, Encryption - Governance: Resource Monitors, Data Masking, Row/Column Security - Access Control: RBAC, DAC, Roles, Privileges
Topic 3: Snowflake Architecture & Core Concepts	31%	- Cloud Services Layer, Compute Layer, Storage Layer - Virtual Warehouses, Clustering, Caching - Snowsight Interface, Core Platform Features - Databases, Schemas, Objects, Data Types
Topic 4: Performance Optimization, Querying & Transformation	21%	- Materialized Views, Streams, Tasks, Pipelines - Cortex AI, Notebooks, Apache Iceberg Tables - SQL Transformations, Semi-structured/Unstructured Data - Query Processing, Profiling, Optimization
Topic 5: Data Loading, Unloading & Connectivity	18%	- External Integrations, Connectors, SnowSQL - Stages, File Formats, COPY INTO, Snowpipe - Bulk Load, Streaming, Dynamic Tables - Unloading Data, Export Options

Snowflake SnowPro® Core Certification 2026 Exam (COF-C03) Sample Questions (Q414-Q419):

NEW QUESTION # 414

What is the minimum Snowflake edition needed for database failover and fail-back between Snowflake accounts for business continuity and disaster recovery?

- A. Enterprise
- B. Business Critical
- C. Standard
- D. Virtual Private Snowflake

Answer: B

Explanation:

The minimum Snowflake edition required for database failover and fail-back between Snowflake accounts for business continuity and disaster recovery is the Business Critical edition. References: Snowflake Documentation³.

NEW QUESTION # 415

If 3 size Small virtual warehouse is made up of two servers, how many servers make up a Large warehouse?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

In Snowflake, each size increase in virtual warehouses doubles the number of servers. Therefore, if a sizeSmall virtual warehouse is made up of two servers, a Large warehouse, which is two sizes larger, would be made up of eight servers (2 servers for Small, 4 for Medium, and 8 for Large).

Size specifies the amount of compute resources available per cluster in a warehouse. Snowflake supports the following warehouse sizes:

Warehouse Size	Credits / Hour	Credits / Second	Notes
X-Small	1	0.0003	Default size for warehouses created using CREATE WAREHOUSE.
Small	2	0.0006	
Medium	4	0.0011	
Large	8	0.0022	
X-Large	16	0.0044	Default for warehouses created in the web interface.
2X-Large	32	0.0089	
3X-Large	64	0.0178	
4X-Large	128	0.0356	
5X-Large	256	0.0711	Preview feature.
6X-Large	512	0.1422	Preview feature.

NEW QUESTION # 416

A user creates two tasks:

* Task A loads data into a staging table.

* Task B transforms the data and is configured as a child task that depends on Task A.

After resuming Task A, the user notices that Task B never runs, even though Task A completes successfully.

What is the reason?

- A. Task A and Task B are assigned to different warehouses.
- **B. Task B is suspended and must also be resumed.**
- C. Task B must have its own schedule.
- D. Task B's schedule conflicts with Task A's schedule interval.

Answer: B

Explanation:

Newly created tasks are suspended by default. Resuming the root task does not automatically resume suspended child tasks in a task graph.

A child task does not need its own schedule. It runs after its predecessor completes successfully, subject to any task conditions. However, the child task must be in a started or resumed state.

The task graph can be enabled by resuming each task individually or by using the system function designed to enable dependent tasks.

Tasks in a graph can use different warehouses. That configuration does not, by itself, prevent a child task from running.

NEW QUESTION # 417

Users who do not have a Snowflake account need access to a staged file. Which command will generate a URL that will provide access to those users?

- A. `GET_RELATIVE_PATH(@ < stage_name > , ' < absolute_file_path > ' );`
- B. `BUILD_SCOPED_FILE_URL(@ < stage_name > , ' < relative_file_path > ' );`
- C. `BUILD_STAGE_FILE_URL(@ < stage_name > , ' < relative_file_path > ' );`
- **D. `GET_PREIGNED_URL(@ < stage_name > , ' < relative_file_path > ' , [ < expiration_time > ] );`**

Answer: D

Explanation:

The correct answer is B. `GET_PREIGNED_URL(@ < stage_name > , ' < relative_file_path > ' , [ < expiration_time > ] );` .

A pre-signed URL provides temporary access to a staged file. This is useful when users or applications outside Snowflake need access to a file for a limited period of time.

Why B is correct:

`GET_PREIGNED_URL` generates a pre-signed URL for a staged file. The URL can be used to access the file without the user needing a Snowflake account, as long as the URL has not expired.

Example:

```
SELECT GET_PREIGNED_URL(@my_stage, ' folder/file.csv ' , 3600);
```

This generates a URL that is valid for a limited time, such as 3600 seconds.

Why the other options are incorrect:

A). `BUILD_STAGE_FILE_URL` creates a Snowflake file URL, but it does not provide the same temporary external access behavior as a pre-signed URL.

C). `GET_RELATIVE_PATH` returns the relative path of a staged file, not an access URL.

D). `BUILD_SCOPED_FILE_URL` creates a scoped URL that is useful within Snowflake-controlled contexts, but for users without Snowflake accounts who need direct temporary access, `GET_PREIGNED_URL` is the best answer.

Official Snowflake documentation reference:

Snowflake documentation describes `GET_PREIGNED_URL` as a function that returns a pre-signed URL for a staged file, with an optional expiration time.

NEW QUESTION # 418

When unloading data from Snowflake using the COPY INTO < location > command, what is a key consideration for handling NULL values?

- A. NULL values are automatically converted to empty strings.
- B. NULL values are automatically skipped during the unload process.
- C. A string value should be specified to represent NULL values using the NULL_IF option.
- D. If a NULL value is detected during data loading, the process will stop and report an error.

Answer: C

Explanation:

The correct answer is B. A string value should be specified to represent NULL values using the NULL_IF option .

When unloading data from Snowflake into files using the COPY INTO < location > command, Snowflake needs a textual representation for SQL NULL values in the unloaded files. This can be controlled by the NULL_IF file format option.

Why B is correct:

The NULL_IF option specifies one or more string values that represent SQL NULL values. During unloading, Snowflake uses this option to determine how NULL values should appear in the output files.

For example, a file format could specify:

NULL_IF = (' NULL ')

This means SQL NULL values can be written using the string NULL in the unloaded file.

Why the other options are incorrect:

A). Snowflake does not always automatically convert NULL values to empty strings in all unload scenarios.

The representation depends on file format settings.

C). NULL values do not cause the unload process to stop with an error by default.

D). NULL values are not automatically skipped during unloading. They are included in the output using the configured representation.

Official Snowflake documentation reference:

Snowflake documentation for file format options explains that NULL_IF specifies the string used to represent SQL NULL values when loading or unloading data.
