

# Reliable SAP-C02 Test Questions - Latest SAP-C02 Braindumps Free

DOWNLOAD the newest ITexamReview SAP-C02 PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1MbIderuRUqapVMltL7tXJudkt0AmAjIB>

ITexamReview has designed AWS Certified Solutions Architect - Professional (SAP-C02) which has actual exam Dumps questions, especially for the students who are willing to pass the Amazon SAP-C02 exam for the betterment of their future. The study material is available in three different formats. Amazon Practice Exam are also available so the students can test their preparation with unlimited tries and pass AWS Certified Solutions Architect - Professional (SAP-C02) (SAP-C02) certification exam on the first try.

The SAP-C02 exam is a comprehensive, two-part exam that tests the candidate's ability to design and deploy AWS services and solutions in a variety of scenarios. SAP-C02 exam covers a wide range of topics, including AWS architecture, security, networking, data storage, and troubleshooting. Candidates must demonstrate their ability to design and implement complex AWS architectures, optimize performance and cost, and manage security and compliance requirements. The SAP-C02 Exam is challenging, but passing it can open up many career opportunities for AWS professionals, including high-paying roles as senior solutions architects or cloud infrastructure architects.

## Amazon - SAP-C02 - AWS Certified Solutions Architect - Professional (SAP-C02) High Hit-Rate Reliable Test Questions

You will earn the Amazon SAP-C02 certification on the first try if you use SAP-C02 Questions. Our high-quality Amazon SAP-C02 practice questions preparation material in three formats will help you crack the Amazon SAP-C02 Exam in one go. For the Amazon SAP-C02 exam dumps, we offer Amazon SAP-C02 PDF questions, desktop SAP-C02 practice test software, and web-based SAP-C02 practice exam software.

The Amazon SAP-C02 Exam is intended for experienced IT professionals who have a minimum of two years of hands-on experience in designing and deploying AWS-based applications and architectures. SAP-C02 exam measures the candidate's ability to design and deploy complex AWS-based systems and applications, as well as their ability to provide guidance and recommendations to stakeholders on the best practices for AWS design and deployment.

## Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q381-Q386):

### NEW QUESTION # 381

A company plans to migrate to AWS. A solutions architect uses AWS Application Discovery Service over the fleet and discovers that there is an Oracle data warehouse and several PostgreSQL databases. Which combination of migration patterns will reduce licensing costs and operational overhead? (Select TWO.)

- A. Lift and shift the PostgreSQL databases to Amazon EC2 using AWS DMS.

- B. Migrate the Oracle data warehouse to an Amazon EMR managed cluster using AWS DMS.
- C. Lift and shift the Oracle data warehouse to Amazon EC2 using AWS DMS.
- **D. Migrate the PostgreSQL databases to Amazon RDS for PostgreSQL using AWS DMS**
- **E. Migrate the Oracle data warehouse to Amazon Redshift using AWS SCT and AWS QMS.**

**Answer: D,E**

Explanation:

<https://aws.amazon.com/getting-started/hands-on/migrate-oracle-to-amazon-redshift/>

<https://docs.aws.amazon.com/prescriptive-guidance/latest/patterns/migrate-an-on-premises-postgresql-database-to-amazon-rds-for-postgresql.html>

### NEW QUESTION # 382

A medical company is running a REST API on a set of Amazon EC2 instances. The EC2 instances run in an Auto Scaling group behind an Application Load Balancer (ALB). The ALB runs in three public subnets, and the EC2 instances run in three private subnets. The company has deployed an Amazon CloudFront distribution that has the ALB as the only origin.

Which solution should a solutions architect recommend to enhance the origin security?

- A. Store a random string in AWS Secrets Manager. Create an AWS Lambda function for automatic secret rotation. Configure CloudFront to inject the random string as a custom HTTP header for the origin request. Create an AWS WAF web ACL rule with a string match rule for the custom header. Associate the web ACL with the ALB.
- B. Store a random string in AWS Systems Manager Parameter Store. Configure Parameter Store automatic rotation for the string. Configure CloudFront to inject the random string as a custom HTTP header for the origin request. Inspect the value of the custom HTTP header, and block access in the ALB.
- C. Create an AWS WAF web ACL rule with an IP match condition of the CloudFront service IP address ranges. Associate the web ACL with the ALB. Move the ALB into the three private subnets.
- **D. Configure AWS Shield Advanced. Create a security group policy to allow connections from CloudFront service IP address ranges. Add the policy to AWS Shield Advanced, and attach the policy to the ALB.**

**Answer: D**

Explanation:

Explanation

<https://docs.aws.amazon.com/autoscaling/ec2/userguide/as-suspend-resume-processes.html> it shows For Amazon EC2 Auto Scaling, there are two primary process types: Launch and Terminate. The Launch process adds a new Amazon EC2 instance to an Auto Scaling group, increasing its capacity. The Terminate process removes an Amazon EC2 instance from the group, decreasing its capacity. HealthCheck process for EC2 autoscaling is not a primary process! It is a process along with the following AddToLoadBalancer AlarmNotification AZRebalance HealthCheck InstanceRefresh ReplaceUnhealthy ScheduledActions From the requirements, Some EC2 instances are now being marked as unhealthy and are being terminated. Application is running at reduced capacity not because instances are marked unhealthy but because they are being terminated.

<https://docs.aws.amazon.com/autoscaling/ec2/userguide/as-suspend-resume-processes.html#choosing-suspend-re>

### NEW QUESTION # 383

A company runs a Java application that has complex dependencies on VMs that are in the company's data center. The application is stable, but the company wants to modernize the technology stack. The company wants to migrate the application to AWS and minimize the administrative overhead to maintain the servers.

Which solution will meet these requirements with the LEAST code changes?

- A. Migrate the application to Amazon Elastic Kubernetes Service (Amazon EKS) on EKS managed node groups by using AWS App2Container. Store container images in Amazon Elastic Container Registry (Amazon ECR). Give the EKS nodes permission to access the ECR image repository. Use Amazon API Gateway to interact with the application.
- B. Migrate the application to Amazon Elastic Container Service (Amazon ECS) on AWS Fargate by using AWS App2Container. Store container images in Amazon Elastic Container Registry (Amazon ECR). Grant the ECS task execution role permission to access the ECR image repository. Configure Amazon ECS to use an Application Load Balancer (ALB). Use the ALB to interact with the application.
- **C. Migrate the application code to a container that runs in AWS Lambda. Build an Amazon API Gateway REST API with Lambda integration. Use API Gateway to interact with the application.**
- D. Migrate the application code to a container that runs in AWS Lambda. Configure Lambda to use an Application Load Balancer (ALB). Use the ALB to interact with the application.

**Answer: C**

#### NEW QUESTION # 384

A retail company is hosting an ecommerce website on AWS across multiple AWS Regions. The company wants the website to be operational at all times for online purchases. The website stores data in an Amazon RDS for MySQL DB instance.

Which solution will provide the HIGHEST availability for the database?

- A. Configure global tables and automated backups on Amazon RDS. In the case of disruption, use AWS Lambda to copy the read replicas from one Region to another Region.
- B. Configure global tables and read replicas on Amazon RDS. Activate the cross-Region scope. In the case of disruption, use AWS Lambda to copy the read replicas from one Region to another Region.
- C. Configure automated backups on Amazon RDS. In the case of disruption, promote an automated backup to be a standalone DB instance. Direct database traffic to the promoted DB instance. Create a replacement read replica that has the promoted DB instance as its source.
- **D. Configure read replicas on Amazon RDS. In the case of disruption, promote a cross-Region read replica to be a standalone DB instance. Direct database traffic to the promoted DB instance. Create a replacement read replica that has the promoted DB instance as its source.**

**Answer: D**

Explanation:

This solution will provide the highest availability for the database, as the read replicas will allow the database to be available in multiple Regions, thus reducing the chances of disruption. Additionally, the promotion of the cross-Region read replica to become a standalone DB instance will ensure that the database is still available even if one of the Regions experiences disruptions.

#### NEW QUESTION # 385

A company has many services running in its on-premises data center. The data center is connected to AWS using AWS Direct Connect (DX) and an IPsec VPN. The service data is sensitive and connectivity cannot traverse the internet. The company wants to expand to a new market segment and begin offering its services to other companies that are using AWS.

Which solution will meet these requirements?

- A. Attach an internet gateway to the VPC. and ensure that network access control and security group rules allow the relevant inbound and outbound traffic.
- **B. Create a VPC Endpoint Service that accepts HTTP or HTTPS traffic, host it behind an Application Load Balancer, and make the service available over DX.**
- C. Create a VPC Endpoint Service that accepts TCP traffic, host it behind a Network Load Balancer, and make the service available over DX.
- D. Attach a NAT gateway to the VPC. and ensure that network access control and security group rules allow the relevant inbound and outbound traffic.

**Answer: B**

Explanation:

To offer services to other companies using AWS without traversing the internet, creating a VPC Endpoint Service hosted behind an Application Load Balancer (ALB) and making it available over AWS Direct Connect (DX) is the most suitable solution. This approach ensures that the service traffic remains within the AWS network, adhering to the requirement that connectivity must not traverse the internet. An ALB is capable of handling HTTP/HTTPS traffic, making it appropriate for web-based services. Utilizing DX for connectivity between the on-premises data center and AWS further secures and optimizes the network path.

References:

AWS Direct Connect Documentation: Explains how to set up DX for private connectivity between AWS and an on-premises network.

Amazon VPC Endpoint Services (AWS PrivateLink) Documentation: Provides details on creating and configuring endpoint services for private, secure access to services hosted in AWS.

AWS Application Load Balancer Documentation: Offers guidance on configuring ALBs to distribute HTTP/HTTPS traffic efficiently.
