問題 #24

Which Kubernetes object is used to grant permissions to a cluster-wide resource?

- A. RoleBinding
- B. ClusterRoleBinding
- C. RoleReference
- D. ClusterRoleAccess

答案： B

解題說明：

In Kubernetes RBAC, ClusterRoleBinding is the mechanism for granting permissions to resources that are not namespace-scoped. The documentation integrated into VCF 9.0 explains: "ClusterRoleBinding binds a user, group, or service account to a ClusterRole, granting cluster-wide permissions to non-namespaced resources such as nodes, storage classes, or persistent volumes." A RoleBinding grants access to namespace-scoped resources. RoleReference is a field within a RoleBinding/ClusterRoleBinding object, not a standalone object. ClusterRoleAccess is not a valid Kubernetes construct.

Thus, to assign permissions at a cluster-wide level, the correct object is ClusterRoleBinding.

問題 #25

Which three tasks must an administrator complete to enable Audit Events in VCF Operations?
(Choose three.)

- A. Configure vCenter server instances in VCF Operations for Logs.
- **B. Enable Audit Events in VCF Operations.**
- C. Configure VCF Operations Content Pack in VCF Operations for Logs.
- **D. Configure VCF Operations for Logs Integration in VCF Operations.**
- **E. Install VCF Operations for Logs.**
- F. Enable Audit Events in VCF Operations for Logs.

答案: **B,D,E**

解題說明:

Enable Audit Events in VCF Operations so the feature is active in the platform.

Install VCF Operations for Logs, since audit events are captured and processed through the logging component.

Configure VCF Operations for Logs Integration in VCF Operations, ensuring that the audit event data flows into the operations console for visibility and compliance.

問題 #26

An administrator is tasked with creating a workload domain using Fibre Channel as the principal storage type.

Which of the following prerequisites must be verified and prepared before the workload domain creation process can start?

- **A. Ensure the storage Logical Unit Number (LUNs) are presented to all ESX hosts.**
- B. Configure a VMkernel interface for storage access to all ESX hosts.
- C. Ensure eligible and supported SSD disks are installed in all ESX hosts.
- D. Configure port binding on all ESX hosts.

答案: **A**

解題說明:

When using Fibre Channel as the principal storage type, the required prerequisite is that the storage Logical Unit Numbers are properly presented and visible to all ESXi hosts so that VMware Cloud Foundation can detect, validate, and use the shared FC storage during workload domain creation.

問題 #27

Which VMware solution can automatically relocate VMs to a secondary data center in the event of a planned migration or unplanned disaster, orchestrating the entire failover process?

- A. vRealize Orchestrator
- B. vSphere Replication
- **C. Site Recovery Manager (SRM)**
- D. vCenter Enhanced Linked Mode

答案: **C**

解題說明:

Site Recovery Manager integrates with vSphere Replication or storage-based replication to automate failover and failback between sites. vSphere Replication alone doesn't orchestrate failover, Enhanced Linked Mode shares configuration between vCenters, and vRealize Orchestrator is a general automation platform.

問題 #28

An organization requires a private cloud with robust availability and disaster recovery capabilities.

Which three VMware Cloud Foundation components should be considered for integration to meet these requirements? (Choose

three.)

- A. NSX for secure and isolated networking
- B. VMware Live Site Recovery (VLSR) for orchestrated disaster recovery.
- C. vSphere Replication for VM-level data replication.
- D. Aria Operations for Logs for enhanced logging and monitoring.
- E. vSAN for hyper-converged storage and downtime avoidance.

答案：A,B,C

解題說明：

NSX provides network virtualization, offering secure, isolated networking that is crucial for ensuring robust availability and disaster recovery. It supports micro-segmentation and advanced network management features.

VMware Live Site Recovery (VLSR) provides orchestrated disaster recovery capabilities, enabling the organization to efficiently recover workloads and applications in case of a disaster.

vSphere Replication enables VM-level data replication, allowing for recovery and continuity of business operations by ensuring data is replicated across sites for high availability and disaster recovery.
