Hundreds of CompTIA aspirants have cracked the CompTIA A+ Core 1 Exam (2026) examination by just preparing with our real test questions. If you also want to become a CompTIA certified without any anxiety, download CompTIA updated test questions and start preparing today. These Real 220-1201 Dumps come in desktop practice exam software, web-based practice test, and 220-1201 PDF document. Below are specifications of these three formats.

CompTIA A+ Core 1 Exam (2026) Sample Questions (Q505-Q510):

NEW QUESTION # 505

An SAS RAID array has severely degraded and gone offline. A systems administrator examines the syslog, and the point of failure is not obvious. Which of the following techniques should the administrator use to identify the issue (Select two).

- A. Check if one of the drives is not level
- B. Run a magnet over each drive.
- C. Listen for clicking and grinding noises
- D. Check the historical SMART data
- E. Update the RAID controller firmware.
- F. Check the OS logs

Answer: C,D

Explanation:

Clicking and grinding noises indicate mechanical drive failure.

SMART data provides insights into the health and status of drives, helping identify failing components in the RAID array.

Why Not A (Run a magnet): This would damage drives.

Why Not B (Check if one drive is not level): Physical leveling is irrelevant.

Why Not D (Check OS logs): OS logs may provide limited information for RAID arrays.

Why Not E (Update RAID controller firmware): While important, it does not diagnose drive failure.

NEW QUESTION # 506

A user is having issues when charging a device with a Lightning cable. The cable is not recognized when it is plugged into the device. This issue is usually resolved by flipping the cable over. This issue does not occur with other devices of the same type. Which of the following would most likely cause the issue?

- A. The device needs to be restarted.
- B. The battery may be swelling and needs inspection.
- C. The cable is failing and needs to be replaced
- **D. The charging port is dirty or damaged**

Answer: D

Explanation:

If flipping the cable helps but the problem is isolated to this device (not others of the same type), the most likely cause is a dirty or damaged charging port on the device itself. Dirt or debris inside the port can prevent a good electrical connection, causing the cable to work intermittently.

NEW QUESTION # 507

A user reports that their desktop PC does not turn on. Which of the following components would most likely cause the issue?

- **A. PSU**
- B. RAM
- C. GPU
- D. CPU

Answer: A

Explanation:

If a desktop fails to power on entirely, the most probable cause is a faulty Power Supply Unit (PSU). If there are no lights, fans, or POST beeps, the PSU may have failed, cutting off all power to the motherboard and components.

Option B (GPU): Could prevent video output, but the system would still power on and beep.

Option C (RAM): Missing or faulty RAM would cause POST errors but not prevent startup entirely.

Option D (CPU): A bad CPU may cause POST failure, but the system would usually at least power on.

Objective 3.5: Given a scenario, troubleshoot problems related to motherboards, RAM, CPU, and power.

NEW QUESTION # 508

An administrator is helping a new employee configure email on a smartphone. The employee also needs access to a shared mailbox. Which is the best email client for this situation?

- **A. Corporate**
- B. Built-in
- C. Employee preferred
- D. Open-source

Answer: A

Explanation:

Corporate clients integrate natively with enterprise email systems, enabling seamless access to shared mailboxes without compatibility issues or admin workarounds.

Built-in phone apps often lack full shared mailbox delegation, open-source options like Thunderbird may require complex

configuration, and employee-preferred apps risk security policy violations.

NEW QUESTION # 509

A local bank is designing its new infrastructure blueprint. Which of the following RAID types offers double parity?

- A. RAID 5
- **B. RAID 6**
- C. RAID 0
- D. RAID 1

Answer: B

Explanation:

RAID 6 is the RAID level that provides double parity, allowing the system to tolerate the failure of two disks simultaneously without data loss. According to CompTIA Core 1 (220-1201) storage and RAID objectives, RAID 6 improves fault tolerance by storing two independent parity blocks across all disks in the array.

RAID 0 provides no parity or redundancy and focuses only on performance through striping. RAID 1 uses mirroring, duplicating data across two drives but does not use parity. RAID 5 uses single parity, allowing recovery from only one failed drive.

For environments such as a local bank, where data integrity and availability are critical, RAID 6 is commonly preferred due to its higher fault tolerance compared to RAID 5. Although RAID 6 has slightly lower write performance due to the additional parity calculation, the increased resilience makes it suitable for mission-critical systems.

CompTIA highlights RAID 6 as a common enterprise solution when both redundancy and reliability are priorities.
