CompTIA Security+ Certification Exam Sample Questions (Q352-Q357):

NEW QUESTION # 352
While updating the security awareness training, a security analyst wants to address issues created if vendors' email accounts are compromised. Which of the following recommendations should the security analyst include in the training?

- A. Delete emails from unknown service provider partners.
- B. Be alert to unexpected requests from familiar email addresses.
- C. Require that invoices be sent as attachments.
- D. Refrain from clicking on images included in emails from new vendors.

Answer: B

Explanation:
Compromised vendor email accounts often lead to business email compromise (BEC) attacks where attackers send malicious or unexpected requests appearing from trusted sources. Training users to be alert to unexpected requests even if they appear to come from familiar addresses is critical in preventing such attacks.
Refraining from clicking images (A) is less effective than being vigilant about suspicious content and requests. Deleting emails from unknown providers (B) is not practical, as some legitimate emails come from unknown senders. Requiring invoices as attachments (C) can increase risk by encouraging users to open potentially malicious attachments.
This user awareness tactic is emphasized in the Security Program Management and Security Awareness training in SY0-701#6:Chapter 16 CompTIA Security+ Study Guide#.

NEW QUESTION # 353
An organization wants to limit potential impact to its log-in database in the event of a breach.
Which of the following options is the security team most likely to recommend?

- A. Tokenization
- B. Obfuscation
- C. Hashing
- D. Segmentation

Answer: C

NEW QUESTION # 354
Which of the following data types relates to data sovereignty?

- A. Data at rest outside of a country's borders
- B. Health data shared between doctors in other nations
- C. Data classified as public in other countries
- D. Personally Identifiable data while traveling

Answer: A

Explanation:
Data sovereignty concerns the laws and governance that apply to data at rest outside of a country's borders. It refers to the legal implications and regulatory controls over where data is stored geographically.
Reference:
CompTIA Security+ SY0-701 Official Study Guide, Domain 5.4: "Data sovereignty refers to data being subject to the laws of the country in which it resides." Exam Objectives 5.4: "Given a scenario, implement data security and privacy practices."

NEW QUESTION # 355
Which of the following would be the best way to handle a critical business application that is running on a legacy server?
* Segmentation

- A. Isolation
- B. Decommissioning
- C. Hardening

Answer: C

Explanation:
A legacy server is a server that is running outdated or unsupported software or hardware, which may pose security risks and compatibility issues. A critical business application is an application that is essential for the operation and continuity of the business, such as accounting, payroll, or inventory management. A legacy server running a critical business application may be difficult to replace or upgrade, but it should not be left unsecured or exposed to potential threats.
One of the best ways to handle a legacy server running a critical business application is to harden it.
Hardening is the process of applying security measures and configurations to a system to reduce its attack surface and vulnerability.
Hardening a legacy server may involve steps such as:
* Applying patches and updates to the operating system and the application, if available
* Removing or disabling unnecessary services, features, or accounts
* Configuring firewall rules and network access control lists to restrict inbound and outbound traffic
* Enabling encryption and authentication for data transmission and storage
* Implementing logging and monitoring tools to detect and respond to anomalous or malicious activity
* Performing regular backups and testing of the system and the application Hardening a legacy server can help protect the critical business application from unauthorized access, modification, or disruption, while maintaining its functionality and availability.
However, hardening a legacy server is not a permanent solution, and it may not be sufficient to address all the security issues and challenges posed by the outdated or unsupported system. Therefore, it is advisable to plan for the eventual decommissioning or migration of the legacy server to a more secure and modern platform, as soon as possible.
