NCP-MCA Latest Test Simulations | NCP-MCA Latest Practice Questions

I want to share valid NCP-MCA Latest Exam Cram review with you. If you are preparing for this exam, you can purchase our dumps for valid preparing plan. Everyone has potential. Our updated latest valid Nutanix NCP-MCA exam cram review covers all exam questions of exam center which guarantee candidates to clear exam successfully and obtain certified certification. Facing pressure examinees should trust themselves, everything will go well.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q62-Q67):

NEW QUESTION # 62

An administrator wants to automatically send a Slack notification when a VM goes into a powered-off state unexpectedly. How should an administrator use Nutanix Cloud Manager to best accomplish this?

- **A. Configure a Playbook triggered by a VM power state change event with an action to send a Slack notification.**
- B. Add a script task to a Blueprint that checks VM status and notifies Slack post-deployment.
- C. Create a scheduled Playbook to check VM status every 6 hours and send an email.
- D. Use a Playbook with a webhook trigger that sends a message to a Slack channel when the VM is shut down manually.

Answer: A

Explanation:

To automate a notification based on a specific change in the environment (such as a VM powering off), the administrator should

leverage Intelligent Operations (X-Play) by creating an event-driven Playbook.

* **Event Trigger:** The "VM Power Off" or "Power State Change" is a system-generated Event. X-Play allows administrators to select this specific event as a Trigger. This ensures the automation runs in real-time immediately when the state change occurs, rather than waiting for a schedule (as in Option A).

* **Action (Slack):** X-Play includes a native Slack action (or "Send to Slack"). The administrator configures this action with the Slack Webhook URL and the desired message content.

* **Why not others?**

* **Option A:** is reactive and delayed (polling every 6 hours).

* **Option B:** only runs once during the initial deployment of the blueprint, not continuously during the VM's lifecycle.

* **Option C:** suggests a Webhook trigger, which requires an external system to invoke the Playbook.

Here, the event originates internally within Nutanix, so an Event Trigger is the correct choice.

NEW QUESTION # 63

The development leadership has submitted a request to run a resource-intensive script after hours on separate test environments for testing application load. The current environments are setup as separate projects within Self-Service (formerly Calm).

Requirements:

* The script needs to run on each test environment.

* The script needs to run at separate times for each test environment.

* The development team needs the ability to modify the script as needed.

How would the administrator accomplish the task?

- **A. Publish Runbook**
- B. Blueprint
- C. Publish Playbook
- D. Playbook

Answer: A

Explanation:

To run a resource-intensive script on separate test environments at different times, the administrator should publish a Runbook.

Runbooks allow for the automation of tasks across multiple environments and can be scheduled to run at specific times. Additionally, they can be modified by the development team as needed to adapt to changes in the script.

NEW QUESTION # 64

Which option is used to test or validate scripts before deployment?

- A. EScript
- B. PowerShell
- **C. Test Script**
- D. Shell

Answer: C

Explanation:

Test Script is a feature of Nutanix Cloud Manager (NCM) Self-Service that allows users to test or validate scripts before

deployment. Test Script enables users to run scripts on a VM without creating a blueprint or a runbook. Users can select a VM,

choose a script type, enter the script content, and execute the script. The output of the script is displayed in the Test Script window.

Test Script can be used to troubleshoot errors, verify functionality, or preview the results of a script before using it in a blueprint or a

runbook. Reference: Nutanix Certified Professional - Multicloud Automation (NCP-MCA) Exam Blueprint Guide, page 14, section

NEW QUESTION # 65

□ An administrator has run a multi-step Playbook. but sees the Failed status, as shown in the exhibit.

What could be causing the playbook to fail?

- A. VM action has a timeout of 5 minutes.
- B. puppet action has a timeout of 5 minutes.
- C. PowerShell action has a timeout of 5 minutes.
- **D. IP Address SSH action has a timeout of 5 minutes.**

Answer: D

Explanation:

The image shows a failed status for an SSH_VM_Task, which is manually triggered. Since the task involves SSH, it's likely that the IP Address SSH action has a timeout of 5 minutes, causing the playbook to fail if it cannot complete within this time frame. The IP Address SSH action is used to execute commands on a remote VM using SSH. It requires the IP address, username, password, and command to run as inputs. The timeout parameter specifies how long the action will wait for the command to finish before aborting. If the timeout is too short, the action may fail due to network latency, slow execution, or other factors. References:

NEW QUESTION # 66

A blueprint was developed for deploying a standard 3-tier hosting environment for a company's applications. The blueprint includes a load balancer, multiple web servers, a database server, and a small test application.

During testing of the blueprint, the application fails to connect to the database. The cause is found to be the database software is still installing when the application starts.

Which method most efficiently prevents the application from starting before the database?

- A. Use a local install instead of downloading
- **B. Create a service dependency**
- C. Use a sleep statement in a start script
- D. Create a loop to retry connection

Answer: B

Explanation:

A service dependency is a feature of Nutanix Calm that allows you to define the order of execution and the conditions for starting and stopping services in a blueprint. By creating a service dependency between the application and the database, you can ensure that the application will not start until the database is fully installed and ready. This avoids the need for manual intervention or inefficient workarounds like loops or sleep statements.
