Free PDF Updated Lpi - 101-500 - LPIC-1 Exam 101, Part 1 of 2, version 5.0 Online Exam

Do you want to pass 101-500 exam in one time? ActualtestPDF exists for the purpose of fulfilling your will, and it will be your best choice because it can meet your needs. After you buy our 101-500 Dumps, we promise you that we will offer free update service in one year. If you fail the exam, we also promise full refund.

The LPIC-1 certification is suitable for those who are just starting their career in Linux administration or those who have some experience in the field. LPIC-1 Exam 101, Part 1 of 2, version 5.0 certification is vendor-neutral, which means that it is not tied to any specific Linux distribution. This makes it a valuable certification for Linux administrators who work with multiple distributions.

Lpi LPIC-1 Exam 101, Part 1 of 2, version 5.0 Sample Questions (Q292-Q297):

NEW QUESTION # 292

Creating a hard link to an ordinary file returns an error. What could be the reason for this?

- A. The source file is already a hard link.
- B. The source file is read-only.
- C. The source file is a shell script.

- D. The source file is hidden.
- E. The source and the target are on different filesystems.

Answer: E

Explanation:

Explanation

The most likely reason for getting an error when creating a hard link to an ordinary file is that the source and the target are on different filesystems. A hard link is a directory entry that points to the same inode as the original file. An inode is a data structure that stores the metadata and location of a file on a filesystem. A hard link cannot span across different filesystems because each filesystem has its own inode table and numbering scheme. Therefore, a hard link can only refer to a file that exists on the same filesystem as the link. This is mentioned in the article by How-To Geek¹ and the man page of `ln`². The other options are not valid reasons for getting an error when creating a hard link. The source file being hidden, read-only, or a shell script does not affect the ability to create a hard link, as long as the user has the appropriate permissions. The source file being already a hard link also does not prevent creating another hard link to the same file, as long as the maximum number of links per inode is not exceeded. This is explained in the article by Linuxize³ and the man page of `ln`.

NEW QUESTION # 293

What is the process ID number of the init process on a SysV init based system?

- A. It is different with each reboot.
- B. 0
- C. It is set to the current run level.
- D. 1
- E. 2

Answer: D

Explanation:

The process ID number of the init process on a SysV init based system is 1. The init process is the first process that runs on the system, and it is responsible for initializing the user-space environment and spawning all other processes. The init process is always the first process that runs on the system, and it has the process ID (PID) of 1. The PID is a unique identifier for each process on the system, and it is assigned by the kernel.

The PID of the init process is always 1, regardless of the reboot or the run level. You can verify the PID of the init process by using the `ps` command, which shows information about the processes on the system. For example, to show the PID, the user, the command, and the arguments of the init process, use the following command:

```
ps -p 1 -o pid,user,cmd
```

The output of the command will show something like:

```
PID USER CMD 1 root /sbin/init
```

This shows that the init process has the PID of 1, the user of root, and the command of /sbin/init.
