### NEW QUESTION # 134

- C. Loading into Lifecycle Controller
- D. Each time the host powers on

**Answer: D**

Explanation:

Understanding Configuration Validation in Dell PowerEdge Servers

Server Troubleshooting (32%)

Explain Configuration Validation, crash capture, and minimum to POST

What is Configuration Validation?

Configuration Validation is a diagnostic process performed by Dell PowerEdge servers to ensure that all hardware components and firmware configurations are compatible and functioning correctly. This process checks for any mismatches or errors in the server's hardware configuration that could prevent the system from booting properly.

When Does Configuration Validation Run?

Each Time the Host Powers On:

Configuration Validation runs automatically during the Power-On Self-Test (POST) sequence every time the server is powered on or rebooted.

The server's BIOS performs a series of checks to validate the hardware configuration, ensuring that all components are present, properly connected, and compatible.

If any discrepancies or issues are detected, the server may halt the boot process and display error messages or indicators to alert the administrator. Importance of Configuration Validation at Power-On:

Hardware Integrity:

Verifies that CPUs, memory modules, storage devices, and other peripherals are correctly installed and operational.

Firmware Compatibility:

Ensures that firmware versions are compatible across components, which is crucial for system stability.

Preventing Boot Failures:

Identifies configuration issues early to prevent system crashes or data loss.

Explanation of Options

Option A: Dell diagnostics is run

Analysis:

Dell Diagnostics is a set of utilities that can be run manually to test hardware components.

It is not automatically executed unless initiated by an administrator.

Conclusion: Incorrect.

Option B: Entering the BIOS

Analysis:

While entering the BIOS allows administrators to view and modify system settings, configuration validation is not specifically triggered by accessing the BIOS. Conclusion: Incorrect.

Option C: Loading into Lifecycle Controller

Analysis:

The Lifecycle Controller is a management tool for deploying, updating, and configuring servers.

Configuration validation is not exclusively run when accessing the Lifecycle Controller.

Conclusion: Incorrect.

Option D: Each time the host powers on

Analysis:

Configuration validation is inherently part of the POST sequence that runs every time the server powers on.

Conclusion: Correct Answer.

Server Troubleshooting (32%)

Explain Configuration Validation, crash capture, and minimum to POST:

Understanding when and how configuration validation occurs is essential for troubleshooting boot-related issues.

Recognizing that this process runs at power-on helps administrators diagnose hardware problems early in the boot sequence.

System Administration (18%)

Verify health status and iDRAC license:

Regular health checks and monitoring complement the automated configuration validation performed during boot.

Conclusion

Configuration Validation runs each time the host powers on as part of the POST process. This ensures that any hardware or configuration issues are detected immediately, allowing administrators to address them promptly and maintain system stability.

What is the reason for this issue not being reported to OME?

- A. Remote servers need to have the iDRAC Enterprise license installed to be able to send alerts.
- B. Remote servers are not configured with OME as the trap destination address. OME was informed of the issue when remote servers sent alerts at 5 PM Friday.
- C. OME only updates its alert database at 5 PM every Friday.
