Lpi 010-160 practice exam on the software help you identify which kind of 010-160 questions are more time-consuming, and they would be able to assess their efficiency in answering questions.

## Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q35-

## Q40):

### NEW QUESTION # 35

Which of the following commands sets the variable USERNAME to the value bob?

- A. USERNAME=bob
- B. set USERNAME bob
- C. \$USERNAME==bob
- D. var USERNAME=bob
- E. USERNAME<=bob

**Answer: A**

Explanation:

Explanation

The correct command to set the variable USERNAME to the value bob is USERNAME=bob. This command assigns the string bob to the variable name USERNAME, using the equal sign (=) as the assignment operator.

There is no space around the equal sign, and the variable name and value are case-sensitive. This command sets a shell variable, which is only valid in the current shell session. To make the variable an environment variable, which can be inherited by child processes and subshells, you need to use the export command, such as export USERNAME=bob. The other commands are not valid for setting variables in Linux. The set command is used to set or unset shell options and positional parameters, not variables. The \$ sign is used to reference the value of a variable, not to assign it. The == sign is used for comparison, not assignment. The var keyword is not used in Linux, but in some other programming languages. The <= sign is used for redirection, not assignment.

### NEW QUESTION # 36

Which of the following directories contains information, documentation and example configuration files for installed software packages?

- A. /etc/defaults/
- B. /doc/
- C. /var/info/
- D. /usr/share/doc/
- E. /usr/examples/

**Answer: D**

Explanation:

The /usr/share/doc/ directory is the standard location for documentation files for installed software packages on Linux systems<sup>12</sup>. It contains subdirectories for each package, which may include README files, manuals, license information, changelogs, examples, and other useful resources<sup>12</sup>. The /usr/share/doc/ directory is part of the Filesystem Hierarchy Standard (FHS), which defines the structure and layout of files and directories on Linux and other Unix-like operating systems<sup>3</sup>.

The other options are incorrect because:

/etc/defaults/ is a directory that contains settings for userland applications or services/daemons<sup>4</sup>.

/var/info/ is not a standard directory on Linux systems. The /var/ directory is used for variable data files, such as logs, caches, spools, and temporary files<sup>3</sup>.

/doc/ is not a standard directory on Linux systems. The / directory is the root of the filesystem hierarchy and contains essential files and directories for booting, restoring, recovering, and/or repairing the system<sup>3</sup>.

/usr/examples/ is not a standard directory on Linux systems. The /usr/ directory is used for shareable, read-only data, such as binaries, libraries, documentation, and source code<sup>3</sup>.

### NEW QUESTION # 37

Which of the following commands shows the absolute path to the current working directory?

- A. cd ..
- **B. pwd**
- C. who
- D. ls -l
- E. cd ~/home

**Answer: B**

#### NEW QUESTION # 38

Which of the following commands creates the ZIP archive poems.zip containing all files in the current directory whose names end in .txt?

- A. zcat \*.txt poems.zip
- B. zip cfz poems.zip \*.txt
- C. cat \*.txt | zip poems.zip
- **D. zip poems.zip \*.txt**
- E. zip \*.txt > poems.zip

**Answer: D**

Explanation:

The zip command is used to create compressed archive files that can contain one or more files or directories. The zip command takes the name of the archive file as the first argument, followed by the names of the files or directories to be included in the archive. You can also use wildcards to match multiple files or directories with a common pattern. For example, the command zip poems.zip \*.txt will create the ZIP archive poems.zip containing all files in the current directory whose names end in .txt. The other commands are either invalid or do not perform the desired operation. The command zip \*.txt > poems.zip will try to create an archive for each file ending in .txt and redirect the output to poems.zip, which is not a valid archive file. The command zcat \*.txt poems.zip will try to decompress and concatenate the contents of the files ending in .txt and poems.zip, which is not a valid ZIP file. The command zip cfz poems.zip \*.txt will fail because the options c, f, and z are not valid for the zip command. The command cat \*.txt | zip poems.zip will try to read the contents of the files ending in .txt from the standard input and create an archive named poems.zip, but this will not preserve the file names or attributes of the original files.
