BONUS!!! Download part of NewPassLeader GH-200 dumps for free: <https://drive.google.com/open?id=1ix6g6BMjtBNXZ1H0f5qC5GDood3BwTIS>

Each question presents the key information to the learners and each answer provides the detailed explanation and verification by the senior experts. The success of our GH-200 study materials cannot be separated from their painstaking efforts. Our system will do an all-around statistics of the sales volume of our GH-200 Study Materials at home and abroad and our clients' positive feedback rate of our GH-200 study materials. Our system will deal with the clients' online consultation and refund issues promptly and efficiently. So our system is great.

A certificate is not only an affirmation of your ability, but also can improve your competitive force in the job market. GH-200 training materials of us can help you pass the exam and get the certificate successfully if you choose us. GH-200 exam dumps are reviewed by experienced experts, they are quite familiar with the exam center, and you can get the latest information of the GH-200 Training Materials if you choose us. We also pass guarantee and money back guarantee if you choose GH-200 exam dumps of us. You give us trust, and we will help you pass the exam successfully.

Top choice of GH-200 Help You Gain Success in GitHub Actions. Use Valid Microsoft New Free GH-200 - GitHub Actions. Real GH-200 exam questions updates from NewPassLeader. Microsoft certification test preparation journey today. Best of Luck! GH-200 certification is a valuable certification that will recognize your expertise and knowledge in the modern IT world. NewPassLeader's exam preparation can enable you to pass the GitHub Actions exam easily. You can get help from GH-200 Practice Test.

Microsoft GitHub Actions Sample Questions (Q83-Q88):

NEW QUESTION # 83

Which workflow command would output the debug message "action successfully debugged"?

- A. echo "debug-action successfully debugged"
- B. echo ":debug:action successfully debugged"
- C. echo :debug:message=action successfully debugged"
- D. echo ":debug:action successfully debugged."

Answer: B

Explanation:

The `:debug:` syntax is used to output debug messages in GitHub Actions workflows. This command will print the message "action successfully debugged" in the debug logs when the workflow runs.

NEW QUESTION # 84

What is the right method to ensure users approve a workflow before the next step proceeds?

- A. adding users as required reviewers for an environment
- B. granting users repository approval permission
- C. creating a branch protection rule and only allow certain users access
- D. granting users workflow approval permissions

Answer: A

Explanation:

GitHub Actions allows you to configure environment protection rules, where you can require specific users or teams to approve the deployment before the workflow proceeds to the next step.

This ensures that the required reviewers approve the workflow before any sensitive actions (such as deployment) occur.

Note: Managing environments for deployment

You can create environments and secure those environments with deployment protection rules. A job that references an environment must follow any protection rules for the environment before running or accessing the environment's secrets.

Optionally, you can specify people or teams that must approve workflow jobs that use this environment.

Select Required reviewers.

Enter up to 6 people or teams. Only one of the required reviewers needs to approve the job for it to proceed.

Optionally, to prevent users from approving workflows runs that they triggered, select Prevent self-review.

Click Save protection rules.

<https://docs.github.com/en/actions/how-tos/deploy/configure-and-manage-deployments/manage-environments>

NEW QUESTION # 85

Which action type should be used to bundle a series of run steps into a reusable custom action?

- A. JavaScript action
- B. Composite action
- C. Bash script action
- D. Docker container action

Answer: B

Explanation:

Reusable workflows versus composite actions

Reusable workflows and composite actions both help you avoid duplicating workflow content.

Whereas reusable workflows allow you to reuse an entire workflow, with multiple jobs and steps, composite actions combine multiple steps that you can then run within a job step, just like any other action.

A composite action allows you to bundle multiple steps into a single reusable action within a workflow. It is composed of multiple run steps or other actions and can be reused across workflows, making it the perfect choice for bundling a series of steps.

Reference:

<https://docs.github.com/en/actions/concepts/workflows-and-actions/reusable-workflows>

NEW QUESTION # 86

Which scopes are available to define custom environment variables within a workflow file? (Choose three.)

- A. the contents of a job within a workflow, by using `jobs.<job_id>.env`
- B. within the `run` attribute of a job step
- C. all jobs being run on a single Actions runner, by using `runner.env` at the top of the workflow file
- D. the entire stage, by using `env` at the top of the defined build stage
- E. the entire workflow, by using `env` at the top level of the workflow file

- F. a specific step within a job, by using jobs.<job_id>.steps[*].env

Answer: B,E,F

Explanation:

You can define environment variables for the entire workflow by using the env key at the top level of the workflow file. These environment variables will be available to all jobs and steps within the workflow.

Environment variables can also be set within the run attribute of a job step, and these variables will be scoped only to that specific step.

You can set environment variables for specific steps within a job by using jobs.<job_id>.steps[*].env, which allows you to define variables that will only be available to that step.

NEW QUESTION # 87

You are a DevOps engineer working on a custom action. You want to conditionally run a script at the start of the action, before the main entrypoint. Which code block should be used to define the metadata file for your custom action?

- A. runs:

```
using: 'node16'
before: 'start.js'
before-if: github.event_name == 'push'
main: 'index.js'
```
- B. runs:

```
using: 'node16'
pre-if: github.event_name == 'push' then 'start.js'
main: 'index.js'
```
- C. runs:

```
using: 'node16'
pre: 'start.js'
pre-if: github.event_name == 'push'
main: 'index.js'
```
- D. runs:

```
using: 'node16'
start: 'start.js'
start-if: github.event_name == 'push'
main: 'index.js'
```

Answer: C

Explanation:

The pre: line before the pre-if line.

Note: runs,pre-if

Optional

Allows you to define conditions for the pre: action execution. The pre: action will only run if the conditions in pre-if are met. If not set, then pre-if defaults to always(). In pre-if, status check functions evaluate against the job's status, not the action's own status.

Note that the step context is unavailable, as no steps have run yet.

In this example, cleanup.js only runs on Linux-based runners:

```
pre: 'cleanup.js'
pre-if: runner.os == 'linux'
```
