Fortinet EMEA Advanced Support Exam Sample Questions (Q19-Q24):

NEW QUESTION # 19

What happens when a router receives a packet for forwarding with a TTL value of 1?

- A. It increments it and passes it on to the next router
- B. It decreases the value to 0 and then forwards it
- C. The packet is only forwarded through the router to a locally attached network
- **D. The TTL is decreased to 0, the packet is dropped and an ICMP message is sent to the transmitting IP**

Answer: D

Explanation:

When a router, such as a FortiGate, receives a packet with a TTL (Time to Live) of 1, it decrements the TTL to 0, drops the packet, and sends an ICMP Time Exceeded message to the source IP. This prevents infinite loops in routing. Option A is incorrect as TTL is decremented, not incremented; B and D are incorrect as the packet is not forwarded when TTL reaches 0. Exact extract: "When a packet's TTL reaches 1, the router decrements it to 0, drops the packet, and sends an ICMP Time Exceeded message to the source IP address to prevent routing loops."

NEW QUESTION # 20

In VMware vSphere, the term VMotion refers to

- A. The process used to describe the movement of hard drive platters on a virtual machine
- B. The streaming of high definition video on a virtual machine
- C. The patented technology available to migrate a server from Hyper-V to VMware
- **D. A zero downtime live migration of workloads from one server to another**

Answer: D

Explanation:

VMotion in VMware vSphere enables live migration of running virtual machines from one physical server to another with zero downtime, ensuring continuous operation. Fortinet's FortiGate-VM supports such environments. Options A, C, and D are incorrect as they do not describe VMotion; C refers to a different migration scenario, and D is unrelated to virtualization. Exact extract: "VMotion allows the live migration of a running virtual machine from one physical server to another with no downtime... This ensures workloads continue running during server maintenance or load balancing."

NEW QUESTION # 21

Which FortiGate feature supports load balancing across multiple WAN links?

- A. Link Aggregation
- **B. SD-WAN**
- C. Multi-Path Routing
- D. Virtual Routing

Answer: B

Explanation:

FortiGate's SD-WAN feature enables load balancing and intelligent traffic steering across multiple WAN links based on criteria like bandwidth, latency, or application. Link Aggregation (B) bonds interfaces, Virtual Routing (C) is VRF, and Multi-Path Routing (D) is not a standard term. Exact extract: "SD-WAN enables load balancing and traffic steering across multiple WAN links, optimizing performance and reliability based on configured rules and metrics."

NEW QUESTION # 22

What are source and destination MAC addresses of an ARP request?

- A. The source MAC is that of the sending device and the destination is a multicast address
- **B. The source MAC is that of the sending device and the destination MAC is a broadcast address**
- C. The source MAC is that of the sending device and the destination of the targeted device
- D. The source MAC is that of the forwarding switch and destination of the targeted device

Answer: B

Explanation:

An ARP (Address Resolution Protocol) request is broadcast to resolve an IP address to a MAC address. The source MAC is the sender's MAC address, and the destination MAC is the broadcast address (FF:FF:FF:FF:FF:FF) to reach all devices on the local network. Fortinet devices handle ARP for Layer 2 communication.

Options B, C, and D are incorrect as switches don't originate ARP requests, the target's MAC is unknown, and ARP uses broadcast, not multicast. Exact extract: "In an ARP request, the source MAC address is that of the sending device, and the destination MAC address is the broadcast address (FF:FF:FF:FF:FF:FF), sent to all devices in the local network segment."

Options B, C, and D are incorrect as switches don't originate ARP requests, the target's MAC is unknown, and ARP uses broadcast, not multicast. Exact extract: "In an ARP request, the source MAC address is that of the sending device, and the destination MAC address is the broadcast address (FF:FF:FF:FF:FF:FF), sent to all devices in the local network segment."

NEW QUESTION # 23

How does a stateful firewall control a TCP session?

- A. TCP destination ports are used to control the session
- B. TCP source ports are used to control the session
- **C. TCP sequence numbers and TCP flags are used to control the session**
- D. TCP ack numbers are used to control the session

Answer: C

Explanation:

A stateful firewall, like FortiGate, tracks TCP sessions by maintaining a state table that includes TCP sequence numbers and flags (e.g., SYN, ACK, FIN) to monitor the connection's lifecycle (establishment, data transfer, termination). This ensures proper session handling, detecting out-of-order packets or invalid states.

Source and destination ports identify the session but don't control its state, and ACK numbers alone are insufficient. Exact extract: "Stateful inspection tracks TCP sessions using sequence numbers and TCP flags (SYN, ACK, FIN, etc.) to ensure packets are valid and part of an established session... FortiGate maintains a state table to monitor the TCP connection states."
