The AWS Certified Solutions Architect - Professional certification is highly valued by employers, as it demonstrates an individual's advanced expertise in AWS architecture and design. Individuals who hold this certification are in high demand, as they possess the skills necessary to design and deploy complex and scalable systems on the AWS platform.

Amazon AWS Certified Solutions Architect - Professional Sample Questions (Q327-Q332):

NEW QUESTION # 327

A Solutions Architect is designing the storage layer for a recently purchased application. The application will be running on Amazon EC2 instances and has the following layers and requirements:

- Data layer: A POSIX file system shared across many systems.
- Service layer: Static file content that requires block storage with more than 100k IOPS.

Which combination of AWS services will meet these needs? (Choose two.)

- A. Service layer - Amazon EC2 Ephemeral Storage
- B. Data layer - Amazon EC2 Ephemeral Storage
- C. Data layer - Amazon S3
- D. Data layer - Amazon EFS
- E. Service layer - Amazon EBS volumes with Provisioned IOPS

Answer: C,E

NEW QUESTION # 328

A medical company is running an application in the AWS Cloud. The application simulates the effect of medical drugs in development.

The application consists of two parts configuration and simulation. The configuration part runs in AWS Fargate containers in an Amazon Elastic Container Service (Amazon ECS) cluster. The simulation part runs on large, compute optimized Amazon EC2 instances. Simulations can restart if they are interrupted. The configuration part runs 24 hours a day with a steady load. The simulation part runs only for a few hours each night with a variable load. The company stores simulation results in Amazon S3, and researchers use the results for 30 days. The company must store simulations for 10 years and must be able to retrieve the simulations within 5 hours. Which solution meets these requirements MOST cost-effectively?

- A. Purchase Compute Savings Plans to cover the usage for the configuration part. Purchase EC2 Reserved Instances for the simulation part. Create an S3 Lifecycle policy to transition objects that are older than 30 days to S3 Glacier Deep Archive.
- B. Purchase Compute Savings Plans to cover the usage for the configuration part. Run the simulation part by using EC2 Spot instances. Create an S3 Lifecycle policy to transition objects that are older than 30 days to S3 Glacier.
- C. Purchase an EC2 Instance Savings Plan to cover the usage for the configuration part and the simulation part. Create an S3 Lifecycle policy to transition objects that are older than 30 days to S3 Glacier.
- D. Purchase an EC2 Instance Savings Plan to cover the usage for the configuration part. Run the simulation part by using EC2 Spot Instances. Create an S3 Lifecycle policy to transition objects that are older than 30 days to S3 Intelligent-Tiering.

NEW QUESTION # 329

A solutions architect is designing an AWS account structure for a company that consists of multiple teams. All the teams will work in the same AWS Region. The company needs a VPC that is connected to the on-premises network. The company expects less than

50 Mbps of total traffic to and from the on-premises network.

Which combination of steps will meet these requirements MOST cost-effectively? (Select TWO.)

- A. Create an AWS Cloud Formation template that provisions a VPC and the required subnets. Deploy the template to each AWS account.
- **B. Use AWS Site-to-Site VPN for connectivity to the on-premises network.**
- C. Use AWS Direct Connect for connectivity to the on-premises network.
- D. Use AWS Transit Gateway along with an AWS Site-to-Site VPN for connectivity to the on-premises network. Share the transit gateway by using AWS Resource Access Manager.
- **E. Create an AWS Cloud Formation template that provisions a VPC and the required subnets. Deploy the template to a shared services account. Share the subnets by using AWS Resource Access Manager.**

Answer: B,E

NEW QUESTION # 330

A company runs a Java application that has complex dependencies on VMs that are in the company's data center. The application is stable, but the company wants to modernize the technology stack. The company wants to migrate the application to AWS and minimize the administrative overhead to maintain the servers.

Which solution will meet these requirements with the LEAST code changes?

- A. Migrate the application to Amazon Elastic Container Service (Amazon ECS) on AWS Fargate by using AWS App2Container. Store container images in Amazon Elastic Container Registry (Amazon ECR). Grant the ECS task execution role permission to access the ECR image repository. Configure Amazon ECS to use an Application Load Balancer (ALB). Use the ALB to interact with the application.
- B. Migrate the application code to a container that runs in AWS Lambda. Configure Lambda to use an Application Load Balancer (ALB). Use the ALB to interact with the application.
- C. Migrate the application to Amazon Elastic Kubernetes Service (Amazon EKS) on EKS managed node groups by using AWS App2Container. Store container images in Amazon Elastic Container Registry (Amazon ECR). Give the EKS nodes permission to access the ECR image repository. Use Amazon API Gateway to interact with the application.
- **D. Migrate the application code to a container that runs in AWS Lambda. Build an Amazon API Gateway REST API with Lambda integration. Use API Gateway to interact with the application.**

Answer: D

Explanation:

Explanation

By using AWS App2Container to migrate the application to Amazon ECS, the company can make the migration process easier. Additionally, using Amazon ECR to store the container images and granting the ECS task execution role permission to access the ECR image repository will minimize the administrative overhead to maintain the servers. Finally, configuring Amazon ECS to use an ALB and using the ALB to interact with the application will reduce the amount of code changes needed. This solution will allow the company to modernize their technology stack while minimizing the amount of code changes needed.

NEW QUESTION # 331

A company is migrating its marketing website and content management system from an on-premises data center to AWS. The company wants the AWS application to be deployed in a VPC with Amazon EC2 instances used for the web servers and an Amazon RDS instance for the database.

The company has a runbook document that describes the installation process of the on-premises system. The company would like to base the AWS system on the processes referenced in the runbook document. The runbook document describes the installation and configuration of the operating systems, network settings, the website, and content management system software on the servers. After the migration is complete, the company wants to be able to make changes quickly to take advantage of other AWS features.

How can the application and environment be deployed and automated in AWS, while allowing for future changes?

- A. Write an AWS Cloud Formation template that creates the VPC, the EC2 instances, and the RDS instance for the application Ensure that the rest of the steps in the runbook are updated to reflect any changes that may come from the AWS migration
- **B. Write an AWS CloudFormation template that creates the VPC the EC2 instances, and the RDS instance for the application Include EC2 user data in the AWS Cloud Formation template to install and configure the software.**
- C. Write a Python script that uses the AWS API to create the VP the EC2 instances and the RDS instance for the application Write shell scripts that implement the rest of the steps in the runbook Have the Python script copy and run the shell scripts on the newly created instances to complete the installation
- D. Update the runbook to describe how to create the VP the EC2 instances and the RDS instance for the application by using the AWS Console Make sure that the rest of the steps in the runbook are updated to reflect any changes that may come from the AWS migration

Answer: B
