### Huawei HCIP-Storage V5.5 Sample Questions (Q76-Q81):

#### NEW QUESTION # 76

An enterprise storage device generates a fault alarm. After Engineer A arrives at the customer site, he prepares to collect storage The storage equipment information is passed to R&D for further analysis. What collection methods can Engineer A use to collect information ()

- A. Collect storage system configuration data through the command line
- B. Configure the public network IP for the storage, let R&D log in directly to collect information
- C. Install SmartKit software to collect information
- D. Use DeviceManager to collect logs and alarms

Answer: A,C,D

#### NEW QUESTION # 77

Huawei OceanStor Pacific series is an intelligent scale-out storage product that supports large-scale scale-out and delivers high reliability. Which of the following statements are false about the product's reliability?

- A. The product leverages link aggregation to ensure transmission link redundancy and performs link switchover or isolation to ensure service continuity if a link becomes faulty or subhealthy.
- B. In terms of data reliability, multiple RAID policies are supported based on the traditional disk-level RAID mode.
- C. The product uses the multi-copy technology to implement the intra-node RAID function. If a node is faulty, the system reliability is not degraded and even remains higher than that of the EC mechanism.
- D. The product adopts Kunpeng processors to integrate functions of multiple chips and effectively improve hardware reliability.

Answer: B,C

Explanation:

This question tests knowledge of the reliability features of the Huawei OceanStor Pacific series, as covered in the \*HCIP-Storage V5.5 Training Material (Module 3: Scale-Out Storage Technologies)\*. Let's evaluate each option:

- Option A: False. The training material states: "OceanStor Pacific uses advanced erasure coding (EC) and multi-copy technologies for data reliability, moving beyond traditional disk-level RAID modes." While RAID-like concepts may be used internally, the system primarily relies on distributed EC or replication, not traditional RAID, making this statement inaccurate.

- Option B: True. The material confirms: "Kunpeng processors integrate multiple chip functions, reducing points of failure and enhancing hardware reliability." This is a correct statement.

- Option C: True. The material notes: "Link aggregation ensures transmission link redundancy, with automatic switchover or isolation for faulty or subhealthy links, maintaining service continuity." This is accurate.

- Option D: False. The material clarifies: "Multi-copy technology ensures data redundancy across nodes, but it does not implement intra-node RAID. If a node fails, reliability depends on inter-node copies or EC, and it is not necessarily higher than EC mechanisms, which are optimized for distributed systems." This makes the statement false, as it misrepresents the technology and its comparative reliability.

Thus, options A and D are false.
