## Salesforce Certified MuleSoft Associate Sample Questions (Q24-Q29):

### NEW QUESTION # 24

What are two reasons why a typical MuleSoft customer favors a MuleSoft-hosted Anypoint Platform runtime plane over a customer-hosted runtime for its Mule application deployments? (Choose two.)

- A. increased application isolation
- B. Reduced IT operations effort**
- C. Increased application throughput
- D. Reduced time-to-market for the first application**
- E. Reduced application latency

**Answer: B,D**

Explanation:

Choosing a MuleSoft-hosted Anypoint Platform runtime plane offers several advantages, particularly in terms of deployment efficiency and operational management. Here's a detailed explanation of the selected reasons:

Reduced Time-to-Market for the First Application:

Pre-Configured Environment: MuleSoft-hosted Anypoint Platform provides a ready-to-use environment, which accelerates the deployment process.

Ease of Use: Developers can quickly set up and deploy applications without the need for extensive infrastructure setup and configuration.

Reduced IT Operations Effort:

Managed Services: MuleSoft handles the infrastructure management, including updates, scaling, and maintenance, reducing the operational burden on the IT team.

Focus on Development: IT teams can focus on developing and optimizing applications rather than managing runtime environments.

### NEW QUESTION # 25

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a

design-first approach.

Which characteristics of a design-first approach will help make this API successful?

- A. Publishing the fully implemented API to Exchange so all developers can reuse the API
- B. Building MUnit tests so administrators can confirm code coverage percentage during deployment
- **C. Developing a specification so consumers can test before the implementation is built**
- D. Adding global policies to the API so all developers automatically secure the implementation before coding anything

**Answer: C**

Explanation:

A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:

API Specification:

Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.

Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.

Advantages:

Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.

Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.

Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.

Design-First Approach: Design-First API Development

API Mocking: API Designer Mocking Service

## NEW QUESTION # 26

An organization's IT team must secure all of the internal APIs within an integration solution by using an API proxy to apply required authentication and authorization policies. Which integration technology, when used for its intended purpose should the team choose to meet these requirements if all other relevant factors are equal?

- A. Electronic Data Interchange (EDI)
- B. Integration Platform-as-a-Service (iPaaS)
- C. Robotic Process Automation (RPA)
- **D. API Management (APIM)**

**Answer: D**

Explanation:

Securing internal APIs within an integration solution is critical for protecting sensitive data and ensuring proper access controls. The use of API proxies to apply authentication and authorization policies is a best practice in API security. Here's a detailed explanation:

API Management (APIM):

Purpose: API Management platforms are designed specifically to manage, secure, and monitor APIs. They provide tools for designing, publishing, securing, and analyzing APIs.

Key Features:

Security: APIM platforms offer robust security features such as OAuth, JWT, API keys, and IP whitelisting to authenticate and authorize API consumers.

API Proxies: They allow the creation of API proxies which act as intermediaries between the client and the backend service. This enables enforcing security policies without modifying the backend API.

Implementation:

Authentication and Authorization Policies: Using APIM, the IT team can easily configure policies for authentication (e.g., OAuth 2.0) and authorization to control access to APIs.

Policy Enforcement: These policies are enforced at the API proxy level, ensuring that only authenticated and authorized requests reach the backend services.

Monitoring and Analytics: APIM platforms provide detailed analytics and monitoring capabilities to track API usage, detect anomalies, and ensure compliance.

MuleSoft Documentation: API Security

API Management Overview: What is API Management

## NEW QUESTION # 27

An integration architect is designing an API that must accept requests from API clients for both XML and JSON content over HTTP/1.1 by default.

Which API architectural style when used for its intended and typical purposes, should the architect choose to meet these requirements?

- A. REST
- B. SOAP
- C. gRPC
- D. GraphQL

**Answer: A**

Explanation:

REST (Representational State Transfer) is an architectural style commonly used for designing networked applications, particularly APIs that need to handle multiple content types over HTTP. Here's a detailed explanation:

Content Negotiation:

Definition: REST APIs support content negotiation, allowing clients to request either XML or JSON formats by setting the Accept header in HTTP requests.

Flexibility: This capability makes REST ideal for scenarios where an API needs to serve multiple content types.

HTTP Protocol:

Usage: REST APIs operate over HTTP/1.1, making them compatible with web standards and easily accessible by various clients (browsers, mobile apps, etc.).

Methods: Supports standard HTTP methods like GET, POST, PUT, DELETE, allowing for CRUD operations.

Advantages:

Stateless: Each request from a client to server must contain all the information needed to understand and process the request.

Scalability: RESTful services can handle a high load of requests efficiently.

REST API Design: RESTful Web Services

Content Negotiation: HTTP Content Negotiation

## NEW QUESTION # 28

Which Anypoint Platform component helps integration developers discover and share reusable APIs, connectors and templates?

- A. Anypoint Studio
- B. Design Center
- C. API Manager
- D. **Anypoint Exchange**

**Answer: D**

Explanation:

Anypoint Exchange is a component of the Anypoint Platform that helps integration developers discover and share reusable APIs, connectors, and templates. Here's a detailed explanation:

Anypoint Exchange:

Purpose: Acts as a centralized repository for discovering, sharing, and reusing APIs, connectors, templates, and other integration assets.

Discovery: Developers can search for and find existing APIs, connectors, and templates within the organization or from the wider MuleSoft community.

Sharing: Allows developers to publish their APIs and assets, making them available for reuse by others in the organization.

Benefits:

Reusability: Promotes reuse of existing assets, reducing development time and effort.

Collaboration: Facilitates collaboration and sharing of best practices among development teams.

Documentation: Provides comprehensive documentation and usage examples for each asset.
