CompTIA A+ Certification Exam: Core 1 Sample Questions (Q782-Q787):

NEW QUESTION # 782

A technician is configuring the BIOS of a new workstation. The machine will be used for data analytics, and the technician would like to maximize the performance of the CPU. Which of the following BIOS settings should the technician verify?

- A. Virtualization technology
- B. Hyperthreading
- C. GPU settings
- D. BIOS update

Answer: B

Explanation:

Hyperthreading is a feature of some CPUs that allows them to execute two threads (sequences of instructions) simultaneously on each core. Hyperthreading can improve the performance of CPU-intensive tasks, such as data analytics, by increasing the utilization of CPU resources and reducing idle time. The technician should verify that hyperthreading is enabled in the BIOS settings of the workstation.

NEW QUESTION # 783

A user's laptop is having performance issues when the user downloads large files over the internet. Other users with newer laptops are not experiencing any performance issues. Which of the following components should the technician replace?

- A. RAM
- **B. Wi-Fi card**
- C. Hard drive
- D. CPU

Answer: B

NEW QUESTION # 784

Several storms cause mission-critical servers to go offline unexpectedly. A server also goes offline suddenly due to a hardware failure. Upon assessment, the company purchases new UPSs to condition power and allow the OSs to shut down gracefully in the event of a power failure. However, the UPSs are delayed due to supply chain issues. Which of the following can balance a cost-effective solution with uptime requirements?

- A. Purchasing backup generators
- B. Activating a hot site
- C. Increasing input voltage
- **D. Installing redundant PSUs**

Answer: D

Explanation:

* C. Installing redundant PSUs (Power Supply Units):

* Redundant PSUs provide fault tolerance by ensuring that if one power supply fails, another will take over seamlessly.

* This is a cost-effective way to increase uptime while waiting for the UPSs to arrive.

Incorrect Options:

* A. Purchasing backup generators: Generators are costly and are typically used for long-term outages, not as an immediate or cost-effective solution.

* B. Increasing input voltage: This is not a practical solution to hardware failures or power issues.

* D. Activating a hot site: A hot site is an expensive, fully operational backup facility that would not be a cost-effective solution for this scenario.

NEW QUESTION # 785

A technician is unable to connect to a network device via SSH. Which of the following cables should the technician use as an alternative connection method with a laptop?

- **A. Serial**
- B. Lightning
- C. Parallel
- D. HDMI

Answer: A

Explanation:

The correct answer is A. Serial.

A serial cable is a type of cable that can be used to connect a laptop to a network device via a serial port. A serial port is a physical interface that allows data transmission between devices using serial communication, which is a method of sending data one bit at a time over a single wire. Serial ports are often used for console access to network devices, such as routers, switches, firewalls, or

servers, when other methods of connection, such as SSH (Secure Shell), are not available or not working.

SSH is a protocol that allows secure and encrypted remote login and command execution over a network.

SSH uses public key cryptography to authenticate the client and the server, and to encrypt the data exchanged between them. SSH can be accessed through different ports, depending on the configuration of the server and the client. The default port for SSH is 22, but it can be changed to any other port for security reasons.

HDMI (High-Definition Multimedia Interface) is a type of cable that can be used to transmit audio and video signals between devices, such as laptops, monitors, TVs, or projectors. HDMI cables support high-definition video and audio formats, and can also carry Ethernet and power signals. HDMI cables are not suitable for connecting to network devices via SSH, as they are designed for multimedia purposes.

Parallel cables are a type of cable that can be used to connect devices that use parallel communication, which is a method of sending data multiple bits at a time over multiple wires. Parallel cables are often used for connecting printers or scanners to computers, but they are not commonly used for network devices or SSH connections.

Lightning cables are a type of cable that can be used to connect Apple devices, such as iPhones, iPads, or iPods, to computers or chargers. Lightning cables support data transfer and power delivery, and can also be used with adapters to connect to other types of ports, such as USB or HDMI. Lightning cables are not compatible with network devices or SSH connections, as they are specific to Apple products.

Therefore, the only cable that can be used as an alternative connection method with a laptop when SSH is not working is a serial cable. Serial cables can provide console access to network devices and allow configuration and troubleshooting commands to be executed. For more information about SSH and its alternatives, you can refer to the following web search results: Alternatives to SSH, How To Configure Custom Connection Options for your SSH Client, Understanding the SSH Encryption and Connection Process, How to Use Public Key Authentication with SSH.

NEW QUESTION # 786

A system administrator has been tasked with allowing SMTP traffic through the system's host-based firewall. Which of the following ports should the administrator enable?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

Explanation:

Explanation

SMTP (Simple Mail Transfer Protocol) uses port 25 to send email messages between servers¹².

SMTP uses port 25 to send email messages between mail servers. Therefore, the system administrator should enable port 25 to allow SMTP traffic through the host-based firewall. References: CompTIA A+ Certification Study Guide, Tenth Edition, pg. 282
