Given the critical nature of the incident, what can the analyst do to ensure the playbook continues executing the remaining steps?

- A. Contact TAC to resolve the task error, as the playbook cannot proceed without it
- B. Navigate to the step where the error occurred and run the task again
- C. Pause the step with the error, thus automatically triggering the execution of the remaining steps.
- D. Clone the playbook, remove the faulty step and run the new playbook to bypass the error

Answer: C

Explanation:

The correct answer is D - Pause the step with the error, thus automatically triggering the execution of the remaining steps.

When a playbook encounters an error and the analyst does not have permissions to modify or recreate the playbook, the recommended action is to pause the step with the error. This will skip the problematic step and allow the remaining steps of the playbook to execute, ensuring the investigation or response continues.

"Pausing a failed step in the playbook work plan allows the remaining steps to continue executing, useful when immediate playbook edits are not possible due to permission restrictions." Document Reference: XSIAM Analyst ILT Lab Guide.pdf Page: Page 39 (Automation section)
