VMware Cloud Foundation 5.2 Administrator Sample Questions (Q18-Q23):

NEW QUESTION # 18

What is the first step in downloading the vSphere CLI tools to a developer workstation?

- A. Install a compatible version of Java Runtime Environment
- **B. Visit the VMware Downloads page and locate the vSphere CLI tools.**
- C. Configure the workstation's network settings to connect to the vSphere environment.
- D. Register the developer workstation with the Active Directory.

Answer: B

Explanation:

The first step in downloading the vSphere CLI tools is to visit the VMware Downloads page, where the vSphere CLI tools are available. From there, you can select the appropriate version for your environment and begin the download process.

NEW QUESTION # 19

Which tool is most appropriate for diagnosing and resolving a disk failure when using VMware vSAN with Deduplication enabled?

- A. vSphere Client
- B. Aria Operations
- C. vSAN Skyline Health
- D. vSphere CLI (esxcli)

Answer: D

NEW QUESTION # 20

An organization is implementing a downtime avoidance solution and wants to ensure continuous availability of applications across separate sites that are connected via a high bandwidth/low latency link.

Which two VMware Cloud Foundation components support this capability with stretched clusters? (Choose two.)

- A. vSphere
- B. vVOL
- C. vSAN
- D. NSX Firewall
- E. vSphere Replication

Answer: A,C

Explanation:

vSAN: vSAN supports stretched clusters, allowing data to be mirrored across multiple sites to ensure continuous availability and enable high availability for virtual machines in case of a site failure.

vSphere: vSphere also supports stretched clusters, enabling the high availability of applications across multiple sites by allowing virtual machines to be run on either site in the event of a failure.

NEW QUESTION # 21

Which feature of VMware Lifecycle Manager allows an administrator to manage the lifecycle of ESXi hosts by applying a consistent image across the hosts in a cluster? (Choose three.)

- A. Enable SSH on the ESXi hosts to manage encryption keys.
- B. Apply the encryption policy to the existing VMs.
- C. Create an encryption policy in vCenter.
- D. Configure a Key Management Server (KMS) and add it to vCenter
- E. Enable the encryption feature on the ESXi hosts.

Answer: B,C,D

Explanation:

A Key Management Server (KMS) is required to manage encryption keys in the environment, ensuring that encrypted data is securely managed across ESXi hosts.

Creating an encryption policy in vCenter allows administrators to define how encryption is applied to virtual machines and data.

Applying the encryption policy to the existing VMs ensures that the encryption settings are enforced on virtual machines that require protection.

NEW QUESTION # 22

An administrator finds that one of the VMs in the vSphere environment cannot reach its default gateway. The VM is configured with a static IP address, and other VMs on the same port group and VLAN are not experiencing any issues. What should the administrator check to resolve the issue?

- A. Check if the VM has the correct DNS server settings.
- B. Ensure that the VM's network adapter is set to DHCP.
- **C. Check the subnet mask configured on the VM.**
- D. Confirm that the DVS port group is configured correctly.

Answer: C

Explanation:

If the subnet mask is incorrect, the VM may not recognize the gateway as being on the local network, preventing communication even though the gateway itself is reachable by other correctly configured VMs.

Checking and correcting the subnet mask ensures the VM can properly route to its default gateway.
