P.S. Free 2026 Amazon DVA-C02 dumps are available on Google Drive shared by Pass4sureCert: <https://drive.google.com/open?id=1g8WYV5xnY4T0wP2TWXGua-ji1fc-ABnM>

We are a team of the exam questions providers of Amazon braindumps in the IT industry that ensure you to pass actual test 100%. We have experienced and professional IT experts to create the latest DVA-C02 Exam Questions And Answers which are approach to the real DVA-C02 practice test. Try download the free dumps demo.

It can be said that all the content of the DVA-C02 study materials are from the experts in the field of masterpieces, and these are understandable and easy to remember, so users do not have to spend a lot of time to remember and learn. It takes only a little practice on a daily basis to get the desired results. Especially in the face of some difficult problems, the user does not need to worry too much, just learn the DVA-C02 Study Materials provide questions and answers, you can simply pass the exam. This is a wise choice, and in the near future, after using our DVA-C02 training materials, you will realize your dream of a promotion and a raise, because your pay is worth the rewards.

DVA-C02 Online Training - Valid DVA-C02 Exam Objectives

Being respected and gaining a high social status maybe what you always long for. But if you want to achieve that you must own good abilities and profound knowledge in some certain area. You only need 20-30 hours to learn and prepare for the exam, because it is enough for you to grasp all content of our study materials, and the passing rate is very high and about 98%-100%. Our laTest DVA-C02 Quiz torrent provides 3 versions and you can choose the most suitable one for you to learn. All in all, there are many merits of our DVA-C02 quiz prep.

Amazon AWS Certified Developer - Associate Sample Questions (Q58-Q63):

NEW QUESTION # 58

A company uses AWS X-Ray to monitor a serverless application. The components of the application have different request rates. The user interactions and transactions are important to trace, but they are low in volume. The background processes such as application health checks, polling, and connection maintenance generate high volumes of read-only requests.

Currently, the default X-Ray sampling rules are universal for all requests. Only the first request per second and some additional requests are recorded. This setup is not helping the company review the requests based on service or request type.

A developer must configure rules to trace requests based on service or request properties. The developer must trace the user interactions and transactions without wasting effort recording minor background tasks.

Which solution will meet these requirements?

- A. Disable sampling and trace all requests for requests that handle user interactions or transactions.

Sample high-volume read-only requests at a higher rate.

- B. Disable sampling for high-volume read-only requests. Sample at a lower rate for all requests that handle user interactions or transactions.
- C. Disable sampling for high-volume read-only requests. Sample at a higher rate for all requests that handle user interactions or transactions.
- D. Disable sampling and trace all requests for requests that handle user interactions or transactions. Sample high-volume read-only requests at a lower rate.

Answer: D

NEW QUESTION # 59

A developer is creating an AWS Lambda function that searches for Items from an Amazon DynamoDB table that contains customer contact information. The DynamoDB table items have the customers as the partition and additional properties such as customer_type, name, and job_title.

The Lambda function runs whenever a user types a new character into the customer_type text Input. The developer wants to search to return partial matches of all the email_address property of a particular customer type. The developer does not want to recreate the DynamoDB table.

What should the developer do to meet these requirements?

- A. Add a local secondary index (LSI) to the DynamoDB table with customer_type as the partition Key and email_address as the sort Key. Perform a query operation on the LSI by using the begins_with Key condition expression with the email_address property.
- B. Add a global secondary index (GSI) to the DynamoDB table with customer-type input, as the partition key and email_address as the sort key. Perform a query operation on the GSI by using the begins_with key condition expression with the email_address property.
- C. Add a global secondary index (GSI) to the DynamoDB table with email_address as the partition key and customer_type as the sort key. Perform a query operation on the GSI by using the begins_with key condition expressions with the email_address property.
- D. Add a local secondary index (LSI) to the DynamoDB table with job-title as the partition key and email_address as the sort key. Perform a query operation on the LSI by using the begins_with key condition expression with the email_address property.

Answer: B

Explanation:

Explanation

The solution that will meet the requirements is to add a global secondary index (GSI) to the DynamoDB table with customer_type as the partition key and email_address as the sort key. Perform a query operation on the GSI by using the begins_with key condition expression with the email_address property. This way, the developer can search for partial matches of the email_address property of a particular customer type without recreating the DynamoDB table. The other options either involve using a local secondary index (LSI), which requires recreating the table, or using a different partition key, which does not allow filtering by customer_type.

NEW QUESTION # 60

A developer has implemented an AWS Lambda function that inserts new customers into an Amazon RDS database. The function is expected to run hundreds of times each hour. The function and RDS database are in the same VPC. The function is configured to use 512 MB of RAM and is based on the following pseudo code:

After successfully testing the function multiple times, the developer notices that the execution time is longer than expected.

What should the developer do to improve performance?

- A. Increase the size of the RDS database to facilitate an increased number of database connections each hour.
- B. Move the database connection and close statement out of the handler. Place the connection in the global space.
- C. Increase the reserved concurrency of the Lambda function.
- D. Replace Amazon RDS with Amazon DynamoDB to implement control over the number of writes per second.

Answer: B

NEW QUESTION # 61

An Amazon Kinesis Data Firehose delivery stream is receiving customer data that contains personally identifiable information. A developer needs to remove pattern-based customer identifiers from the data and store the modified data in an Amazon S3 bucket. What should the developer do to meet these requirements?

- **A. Implement Kinesis Data Firehose data transformation as an AWS Lambda function. Configure the function to remove the customer identifiers. Set an Amazon S3 bucket as the destination of the delivery stream.**
- B. Launch an Amazon EC2 instance. Set the EC2 instance as the destination of the delivery stream. Run an application on the EC2 instance to remove the customer identifiers. Store the transformed data in an Amazon S3 bucket.
- C. Create an AWS Step Functions workflow to remove the customer identifiers. As the last step in the workflow, store the transformed data in an Amazon S3 bucket. Set the workflow as the destination of the delivery stream.
- D. Create an Amazon OpenSearch Service instance. Set the OpenSearch Service instance as the destination of the delivery stream. Use search and replace to remove the customer identifiers. Export the data to an Amazon S3 bucket.

Answer: A

Explanation:

<https://docs.aws.amazon.com/firehose/latest/dev/data-transformation.html>

NEW QUESTION # 62

A developer at a company needs to create a small application that makes the same API call once each day at a designated time. The company does not have infrastructure in the AWS Cloud yet, but the company wants to implement this functionality on AWS. Which solution meets these requirements in the MOST operationally efficient manner?

- **A. Use an AWS Lambda function that is invoked by an Amazon EventBridge scheduled event.**
- B. Use a Kubernetes cron job that runs on Amazon Elastic Kubernetes Service (Amazon EKS).
- C. Use an AWS Batch job that is submitted to an AWS Batch job queue.
- D. Use an Amazon Linux crontab scheduled job that runs on Amazon EC2.

Answer: A

NEW QUESTION # 63

.....

Never have we made our customers disappointed about our DVA-C02 study guide. So we have enjoyed good reputation in the market for about ten years. In the future, we will stay integrity and research more useful DVA-C02 learning materials for our customers. Please continue supporting our DVA-C02 Exam Questions and we will make a better job with your warm encourages and suggestions. So if you have any opinions about our DVA-C02 learning quiz, just leave them for us.
