

2026 F5CAB3–100% Free New Braindumps Free | Excellent F5CAB3 Actualtest

BONUS!!! Download part of PrepAwayPDF F5CAB3 dumps for free: https://drive.google.com/open?id=1pjKn_EEalPQE0doIw7vzSXbuZr9cwHY-

If you want to F5CAB3 practice testing the product of PrepAwayPDF, feel free to try a free demo and overcome your doubts. A full refund offer according to terms and conditions is also available if you don't clear the BIG-IP Administration Data Plane Configuration (F5CAB3) practice test after using the BIG-IP Administration Data Plane Configuration (F5CAB3) exam product. Purchase PrepAwayPDF best F5CAB3 study material today and get these stunning offers.

F5 F5CAB3 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Apply procedural concepts required to modify and manage pools: This domain addresses managing server pools including health monitors, load balancing methods, priority groups, and service port configurations.
Topic 2	<ul style="list-style-type: none">Apply procedural concepts required to modify and manage virtual servers: This domain covers managing virtual servers including applying persistence, encryption, and protocol profiles, identifying iApp objects, reporting iRules, and showing pool configurations.

F5CAB3 Actualtest - F5CAB3 Latest Exam Forum

A lot of things can't be tried before buying or the product trial will charge a certain fee, but our F5CAB3 exam questions are very different, you can try it free before you buy it. It's like buying clothes, you only know if it is right for you when you try it on. In the same way, in order to really think about our customers, we offer a free trial version of our F5CAB3 study prep for you, so everyone has the opportunity to experience a free trial version of our F5CAB3 learning materials.

F5 BIG-IP Administration Data Plane Configuration Sample Questions (Q21-Q26):

NEW QUESTION # 21

Which type of Virtual Server requires the use of a FastL4 profile?

- A. Stateless

- B. Performance (HTTP)
- C. Standard
- **D. Performance (Layer 4)**

Answer: D

Explanation:

Performance (Layer 4) virtual servers rely on FastL4 profiles to provide high-speed L4 processing without full proxy overhead.

Below is BATCH 2 (next 10 questions) extracted only from your uploaded document that are clearly related to BIG-IP

Administration: Data Plane Configuration topics.

As requested, I have strictly excluded questions related to:

Licensing

HA / Device Trust / Sync-only

Logging destinations

User roles

Hardware, EUD, support processes

System-only administration

Source: Your uploaded TMOS Administration v2.0 document

NEW QUESTION # 22

A virtual server is configured to offload SSL from a pool of backend servers. When users connect to the virtual server, they successfully establish an SSL connection but no content is displayed. A packet trace performed on the server shows that the server receives and responds to the request. What should a BIG-IP Administrator do to resolve the problem?

- A. disable Server SSL profile
- B. disable SNAT
- **C. enable SNAT**
- D. enable Server SSL profile

Answer: C

Explanation:

This scenario describes a classic routing issue often encountered during SSL offload deployments. The fact that an SSL connection is established indicates the Client SSL profile is working correctly. The packet trace showing the server "receives and responds" to the request is the most critical diagnostic clue.

When a BIG-IP receives traffic, it typically passes the client's original source IP address to the backend server. If the backend server's default gateway is not the BIG-IP (a common "one-arm" network topology), the server will attempt to send its response directly back to the client's IP via its own default router. The client's browser will reject this response because it expects traffic to come from the Virtual Server's IP, not the backend server's IP.

To resolve this, the administrator must enable SNAT (Source Address Translation), typically using SNAT Automap. When SNAT is enabled, the BIG-IP replaces the client's original source IP with one of its own Self IPs before forwarding the request to the server. Because the source of the packet is now the BIG-IP, the backend server is forced to send its response back to the BIG-IP. The BIG-IP then receives the response, translates it back, and delivers the content to the user. Option A is unnecessary if the servers are expecting plain-text traffic after the BIG-IP performs offload. Option D would only worsen the existing routing discrepancy.

NEW QUESTION # 23

DNS queries from internal DNS servers fail when sent through a BIG-IP Virtual Server.

Which Virtual Server property should be changed?

- A. Type to Performance (HTTP)
- B. Source Address to subnet
- **C. Protocol to UDP**
- D. Protocol Profile (Client) to DNS_OPTIMIZED

Answer: C

Explanation:

Standard DNS queries use UDP. Configuring the Virtual Server for TCP causes DNS traffic to fail.

NEW QUESTION # 24

A node is a member of multiple pools hosting different web applications. If one application fails, only that pool member should be marked down.

What should be configured?

- A. ICMP + TCP monitor
- **B. HTTP monitor with custom send/receive**
- C. UDP monitor
- D. TCP monitor

Answer: B

Explanation:

Application-specific health checks must validate application responses, which requires HTTP monitors with custom send/receive strings.

NEW QUESTION # 25

Refer to the exhibit.

□ A BIG-IP Administrator configures a Virtual Server to handle HTTPS traffic. Users report that the application is NOT working. Which additional configuration is required to resolve this issue?

- A. Configure SSL Profile (Server)
- B. Configure Protocol Profile (Server)
- C. Configure Service Port to HTTP
- **D. Configure SSL Profile (Client)**

Answer: D

Explanation:

According to the provided exhibit, the "SSL Profile (Client)" section in the Virtual Server configuration is empty. For a BIG-IP system to process HTTPS traffic, it must act as an SSL/TLS endpoint. This process, known as SSL Termination or SSL Offload, requires the assignment of a Client SSL Profile to the Virtual Server. Without this profile, the BIG-IP does not have the necessary certificate and private key information to perform the SSL handshake with the client's browser. Consequently, when a user attempts to connect via HTTPS, the TCP connection may establish, but the SSL handshake will fail because the BIG-IP will not know how to decrypt the incoming encrypted packets.

A Client SSL profile defines the ciphers, certificates, and keys that the BIG-IP uses to communicate securely with the client. In a standard HTTPS deployment, the BIG-IP decrypts the traffic and can then send it to the backend pool members either as plain text (header insertion/manipulation) or re-encrypt it using a Server SSL profile. While a Server SSL profile (Option C) is needed if the backend servers themselves require HTTPS, the initial failure for a user reaching a Virtual Server is almost always the lack of a Client SSL profile to terminate the user's connection. Changing the Service Port to HTTP (Option D) would be incorrect because the goal is to handle HTTPS traffic (typically port 443). Assigning the "clientssl" or a custom client-side profile from the "Available" list to the "Selected" list in the GUI is the mandatory step to make the Virtual Server operational for secure web traffic.

NEW QUESTION # 26

.....

Successful people are never satisfying their current achievements. So they never stop challenging themselves. If you refuse to be an ordinary person, come to learn our F5CAB3 preparation questions. Our F5CAB3 study materials will broaden your horizons and knowledge. Many people have benefited from learning our F5CAB3 learning braindumps. Most of them have realized their dreams and became successful.
