Salesforce Certified MuleSoft Developer II Sample Questions (Q17-Q22):

NEW QUESTION # 17

What is the MuleSoft recommended method to encrypt sensitive property data?

- A. The encryption key should be different for each environment and the sensitive data should be the same for all environments
- B. The encryption key should be identical for all environments and the sensitive data should be different for each environment
- **C. The encryption key and sensitive data should be different for each environment**
- D. The encryption key should be identical for all environments

Answer: C

Explanation:

The MuleSoft recommended method to encrypt sensitive property data is to use the Secure Properties Tool that comes with Anypoint Studio. This tool allows encrypting properties files with a secret key and then decrypting them at runtime using the same key. The encryption key and sensitive data should be different for each environment to ensure security and avoid accidental exposure of sensitive data. NEW QUESTION # 18

Refer to the exhibit.

□ The flow name is "implementation" with code for the MUnit test case.

When the MUnit test case is executed, what is the expected result?

- A. The test throws an error and does not start
- **B. The test case fails with an assertion error**
- C. The test case passes
- D. The test case fails with an unexpected error type

Answer: B

Explanation:

Based on the code snippet and MUnit test case below, when the MUnit test case is executed, the expected result is that the test case fails with an assertion error. This is because the assert-equals processor compares two values for equality, and fails if they are not equal. In this case, the expected value is 'Hello World', but the actual value returned by the implementation flow is 'Hello Mule'. Therefore, the assertion fails and an error is thrown. Reference: <https://docs.mulesoft.com/munit/2.3/assert-equals-processor>

NEW QUESTION # 19

Refer to the exhibits.

Bioinfo System API is implemented and published to Anypoint Exchange. A developer wants to invoke this API using its REST Connector.

What should be added to the POM?

- **A. □**
- B. □
- C. □
- D. □
- E. □

Answer: A

Explanation:

To invoke Bioinfo System API using its REST Connector, option E should be added to the pom.xml file. This option adds a dependency for Bioinfo System API REST Connector with its group ID, artifact ID, version, classifier, and type. The classifier specifies that it is a REST Connector (raml-client), and the type specifies that it is a Mule plugin (mule-plugin). Reference: <https://docs.mulesoft.com/apikit/4.x/apikit-4-generate-from-rest-api-task#add-the-api-dependency-to-the-pom-file>

NEW QUESTION # 20

The Center for Enablement team published a common application as a reusable module to the central Nexus repository. How can the common application be included in all API implementations?

- A. Download the common application from Nexus and copy it to the src/main/resources folder in the API
- B. Add a Maven dependency in the POM file with multiple-plugin as <classifier>
- C. Copy the common application's source XML file and out it in a new flow file in the src/main/mule folder
- **D. Add a Maven dependency in the POM file with jar as <classifier>**

Answer: D

Explanation:

To include a common application as a reusable module in all API implementations, the developer should add a Maven dependency in the POM file with jar as <classifier>. This way, the developer can reuse Mule code from another application by packaging it as a JAR file and adding it as a dependency in the POM file of the API implementation. The classifier element specifies that it is a JAR file. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/mmp-concept#add-a-maven-dependency-to-the-pom-file>

NEW QUESTION # 21

A system API that communicates to an underlying MySQL database is deploying to CloudHub. The DevOps team requires a readiness endpoint to monitor all system APIs.

Which strategy should be used to implement this endpoint?

- A. Create a dedicated endpoint that responds with the API status and health of the server
- B. Use an existing resource endpoint of the API
- **C. Create a dedicated endpoint that responds with the API status and reachability of the underlying systems**
- D. Create a dedicated endpoint that responds with the API status only

Answer: C

Explanation:

To implement a readiness endpoint to monitor all system APIs, the developer should create a dedicated endpoint that responds with the API status and reachability of the underlying systems. This way, the DevOps team can check if the system API is ready to receive requests and if it can communicate with its backend systems without errors. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/deployment-strategies#readiness-probes>
