

Exam ISTQB ISTQB-CTFL Topic | Exam ISTQB-CTFL Exercise

2026 Latest Actualtests4sure ISTQB-CTFL PDF Dumps and ISTQB-CTFL Exam Engine Free Share:
<https://drive.google.com/open?id=1Xt3ZBvBhubFQ7i2Y5sbM8CGNdeefSpEx>

It is an important process that filling in the correct mail address in order that it is easier for us to send our ISTQB-CTFL study guide to you after purchase, therefore, this personal message is particularly important. We are selling virtual ISTQB-CTFL learning dumps, and the order of our ISTQB-CTFL training materials will be immediately automatically sent to each purchaser's mailbox according to our system. It is very fast and convenient to have our ISTQB-CTFL practice questions.

We make the commitment that if you fail to pass your exam by using ISTQB-CTFL study materials of us, we will give you refund. We are pass guarantee and money back guarantee. In addition, ISTQB-CTFL exam dumps are high-quality, and you can improve your efficiency if you use them. ISTQB-CTFL exam materials contain almost all of the knowledge points for the exam, and you master the major knowledge for the exam as well as improve your professional ability in the process of learning. In order to let you obtain the latest information for the exam, we offer you free update for one year, and the update version for ISTQB-CTFL Exam Dumps will be sent to your email automatically.

Exam ISTQB-CTFL Exercise, ISTQB-CTFL Exam Quick Prep

The ISTQB-CTFL study material provided by Actualtests4sure can make you enjoy a boost up in your career and help you get the ISTQB-CTFL certification easily. The 99% pass rate can ensure you get high scores in the actual test. In order to benefit more candidates, we often give some promotion about our ISTQB-CTFL Pdf Files. You will get the most valid and best useful ISTQB-CTFL study material with a reasonable price. Besides, you will enjoy the money refund policy in case of failure.

ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q74-Q79):

NEW QUESTION # 74

An e-commerce site accepts credit cards for processing the payment. The payment processing form has a field for the amount of money to be deducted. The minimum amount of money that can be processed is \$10. The credit cards have a limit of \$5,000 (Five Thousand). Assume that only integers can be accepted as inputs.

Which of the following set of boundary values you will choose for EFFICIENT testing for the amount of money that can be spent?

- A. 9.5001
- B. 10.5000
- C. 10, 11.4999, 5000r 5001
- D. 9. 10.5000,5001

Answer: B

NEW QUESTION # 75

The four test levels used in ISTQB syllabus are:

1. Component (unit) testing
2. Integration testing
3. System testing
4. Acceptance testing

An organization wants to do away with integration testing but otherwise follow V-model. Which of the following statements is correct?

- A. It is not allowed because integration testing is a very important test level and ignoring it means definite poor product quality
- B. It is allowed because integration testing is not an important test level and can be dispensed with.
- C. It is not allowed as organizations can't change the test levels as these are chosen on the basis of the SDLC (software development life cycle) model
- D. It is allowed as organizations can decide on their test levels to do depending on the context of the system under test

Answer: C

Explanation:

The V-model is a software development life cycle model that defines four test levels that correspond to four development phases: component (unit) testing with component design, integration testing with architectural design, system testing with system requirements, and acceptance testing with user requirements. The V-model emphasizes the importance of verifying and validating each phase of development with a corresponding level of testing, and ensuring that the test objectives, test basis, and test artifacts are aligned and consistent across the test levels. Therefore, an organization that wants to follow the V-model cannot do away with integration testing, as it would break the symmetry and completeness of the V-model, and compromise the quality and reliability of the software or system under test. Integration testing is a test level that aims to test the interactions and interfaces between components or subsystems, and to detect any defects or inconsistencies that may arise from the integration of different parts of the software or system. Integration testing is essential for ensuring the functionality, performance, and compatibility of the software or system as a whole, and for identifying and resolving any integration issues early in the development process. Skipping integration testing would increase the risk of finding serious defects later in the test process, or worse, in the production environment, which would be more costly and difficult to fix, and could damage the reputation and credibility of the organization. Therefore, the correct answer is D.

The other options are incorrect because:

* A. It is not allowed as organizations can decide on the test levels to do depending on the context of the system under test. While it is true that the choice and scope of test levels may vary depending on the context of the system under test, such as the size, complexity, criticality, and risk level of the system, the organization cannot simply ignore or skip a test level that is defined and required by the chosen software development life cycle model. The organization must follow the principles and guidelines of the software development life cycle model, and ensure that the test levels are consistent and coherent with the development phases. If the organization wants to have more flexibility and adaptability in choosing

* the test levels, it should consider using a different software development life cycle model, such as an agile or iterative model, that allows for more dynamic and incremental testing approaches.

* B. It is not allowed because integration testing is not an important test level and can be dispensed with.

This statement is false and misleading, as integration testing is a very important test level that cannot be dispensed with. Integration testing is vital for testing the interactions and interfaces between components or subsystems, and for ensuring the functionality, performance, and compatibility of the software or system as a whole. Integration testing can reveal defects or inconsistencies that may not be detected by component (unit) testing alone, such as interface errors, data flow errors, integration logic errors, or performance degradation. Integration testing can also help to verify and validate the architectural design and the integration strategy of the software or system, and to ensure that the software or system meets the specified and expected quality attributes, such as reliability, usability, security, and maintainability.

Integration testing can also provide feedback and confidence to the developers and stakeholders about the progress and quality of the software or system development. Therefore, integration testing is a crucial and indispensable test level that should not be skipped or omitted.

* C. It is not allowed because integration testing is a very important test level and ignoring it means definite poor product quality.

This statement is partially true, as integration testing is a very important test level that should not be ignored, and skipping it could result in poor product quality. However, this statement is too strong and absolute, as it implies that integration testing is the only factor that determines the product quality, and that ignoring it would guarantee a poor product quality. This is not necessarily the case, as there may be other factors that affect the product quality, such as the quality of the requirements, design, code, and other test levels, the effectiveness and efficiency of the test techniques and tools, the competence and experience of the developers and testers, the availability and adequacy of the resources and environment, the management and communication of the project, and the

expectations and satisfaction of the customers and users. Therefore, while integration testing is a very important test level that should not be skipped, it is not the only test level that matters, and skipping it does not necessarily mean definite poor product quality, but rather a higher risk and likelihood of poor product quality.

NEW QUESTION # 76

You are testing a system that is used in motor vehicles to warn the driver of an obstacle when re-versing. Output is provided by a series of LED lights (green, yellow, and red), each illuminated based on clearly defined conditions. The following summary describes the functionality:

*Object within 10 metres, green LED lit.

*Object within 5 metres, yellow LED lit.

*Object within 1 metre, red LED lit.

*Setting sensitivity mode to "ON" will result in only the red LED being lit when the object is within 1 metre.

The following decision table describes the rules associated with the functioning of this proximity warning system:

| Conditions | Rule 1 | Rule 2 | Rule 3 | Rule 4 | Rule 5 | Rule 6 |
|-----------------|--------|--------|--------|--------|--------|--------|
| Distance < 10 m | Y | N | N | Y | N | N |
| Distance < 5 m | N | Y | N | N | Y | N |
| Distance < 1 m | N | N | Y | N | N | Y |
| Sensitivity ON | N | N | N | Y | Y | Y |
| Actions | | | | | | |
| Green LED | Y | N | N | N | N | N |
| Yellow LED | N | Y | N | N | N | N |
| Red LED | N | N | Y | N | N | Y |

Which intended functionality is tested by Rule 5 in the decision table?

- A. Object is within 5 metres of the vehicle and the sensitivity mode is switched "off", resulting in no LED being lit.
- B. Object is within 5 metres of the vehicle and the sensitivity mode is switched "on", resulting in the yellow LED being lit.
- C. Object is within 5 metres of the vehicle and the sensitivity mode is switched "off", resulting in the yellow LED being lit.
- **D. Object is within 5 metres of the vehicle and the sensitivity mode is switched "on", resulting in no LED being lit.**

Answer: D

Explanation:

Rule 5 in the decision table indicates that when the object is within 5 metres of the vehicle and the sensitivity mode is switched "on", no LED is lit. This matches the conditions and actions described in the decision table provided, ensuring that only the red LED is lit when the sensitivity mode is on and the object is within 1 metre, otherwise no LED is lit .

NEW QUESTION # 77

A possible risk of introducing test automation is:

- A. the tool may create additional development dependencies.
- B. the tool will be owned and maintained by developers and replace testers.
- **C. the tool may not be fit-for-purpose.**
- D. the tool may not be compatible with the development platform.

Answer: C

Explanation:

One possible risk of introducing test automation is that the selected tool may not be fit-for-purpose. This means that the tool might not meet the specific needs and requirements of the project, leading to inefficiencies and possibly failing to provide the expected benefits. It is crucial to evaluate and select the appropriate tool based on the project's context and objectives. The ISTQB CTFL syllabus highlights the importance of careful tool evaluation and selection to ensure it aligns with the testing goals and the development

environment.

NEW QUESTION # 78

The following rules determine the annual bonus to be paid to a salesman of a company based on the total annual amount of the sales made (referred to as TAS).

If the TAS is between 50k€ and 80k€, the bonus is 10%. If the TAS exceeds 80k€ by a value not greater than 40k€, the bonus is 15%. Finally, if the TAS

exceeds the maximum threshold which entitles to a 15% bonus, the bonus is 22%.

Consider applying equivalence partitioning to the TAS (Note: 1k€ = 1000 euros).

Which one of the following answers contain only test cases that belong to the same equivalence partition?

- A. TC1 = 81 k€; TC2= 97k€; TC3=111k€; TC4=118k€
- B. TC1 = 40k€; TC2= 46k€; TC3=51k€; TC4=53k€
- C. TC1 = 79k€; TC2= 80k€; TC3=81k€; TC4=82k€
- D. TC1 = 90k€; TC2= 110k€; TC3=125k€; TC4=140k€

Answer: A

Explanation:

This answer is correct because equivalence partitioning is a test design technique that divides the input domain of a system or component into partitions of equivalent data, such that each partition is expected to produce the same output or behavior.

Equivalence partitioning aims to reduce the number of test cases by selecting one representative value from each partition. In this case, the input domain of the TAS can be divided into four partitions based on the bonus rules: less than 50k€, between 50k€ and 80k€, between 80k€ and 120k€, and more than 120k€. The test cases in the answer belong to the same partition, which is between 80k€ and 120k€, and they are expected to produce the same output, which is a bonus of 15%. References:
