Axis Network Video Exam Sample Questions (Q140-Q145):

NEW QUESTION # 140

Which of the following conditions has to be met to use multicast streaming?

- A. The network infrastructure has to support multicast
- B. The client has to run AXIS Camera Management or AXIS Camera Station
- C. The video device needs to run on firmware version 5.20 or higher
- D. The client has to support streaming over RTSP

Answer: A

Explanation:

For multicast streaming to be effective, the network infrastructure must support multicast protocols. This involves network switches and routers that can handle multicast traffic, allowing video streams to be efficiently distributed to multiple clients simultaneously. Multicast reduces the load on the network by sending a single stream of data to multiple receivers, making it essential for large-scale surveillance deployments. NEW QUESTION # 142

IP51 and IP52 means that the camera

- A. Is vandal resistant.
- B. Is designed for tough environments.
- C. Is resistant to dust and dripping water.
- D. Can be placed in or outdoors.

Answer: C

Explanation:

The IP51 and IP52 ratings indicate that the camera is protected against dust and dripping water. IP51 means the camera is protected against dust ingress to a level that would interfere with the operation and against vertically dripping water. IP52 offers the same dust protection but also protects against dripping water when tilted up to 15 degrees. These ratings make the cameras suitable

for indoor use where dust and minor water exposure might occur. Axis Network Video documentation specifies the IP rating system and the levels of protection provided by different ratings.

NEW QUESTION # 143

Typically, a system designer calculates the pixel density based on

- **A. the horizontal resolution and the field of view.**
- B. the aspect ratio and the frame rate.
- C. the illuminance and the depth of field.
- D. the total resolution and the installation height.

Answer: A

Explanation:

Typically, a system designer calculates the pixel density based on the horizontal resolution and the field of view. Pixel density is crucial in determining the level of detail a camera can capture in a specific area.

Horizontal resolution refers to the number of pixels along the horizontal axis of the image sensor, while the field of view is the extent of the observable area captured by the camera. This calculation helps in ensuring that the camera setup meets the surveillance requirements. References: Axis Communications Design Tool

NEW QUESTION # 144

Continuous recording has which benefit?

- **A. No incidents are missed**
- B. Light sensitivity is increased
- C. The recording gets a higher resolution
- D. WDR capabilities are enhanced

Answer: A

Explanation:

Continuous recording ensures that no incidents are missed by capturing video footage continuously, without any gaps. This is crucial in security applications where it is important to have a complete record of events, enabling thorough investigations and evidence collection. Continuous recording ensures that every moment is documented, providing comprehensive coverage and peace of mind.
