We PrepAwayExam are built in years of 2010. Recent years we are offering reliable certification CCCS-203b exam torrent materials and gain new & old customers' praise based on our high pass rate. We put much emphasis on our CCCS-203b exam questions quality and we are trying to provide the best after-sale customer service on CCCS-203b training guide for buyers. If you are looking for professional & high-quality CCCS-203b preparation materials, you can trust us and choose our CCCS-203b study materials. Our CCCS-203b exam guide is able to help you clear exams at the first attempt.

Real CrowdStrike CCCS-203b Exam Questions certification makes you more dedicated and professional as it will provide you complete information required to work within a professional working environment. We have received testimonials from thousands of people who have accomplished CrowdStrike Certified Cloud Specialist (CCCS-203b) only because of the legitimate and trustworthy CCCS-203b exam dumps. It's not simple to achieve CrowdStrike Certified Cloud Specialist (CCCS-203b) exam certification.

If you are also planning to take the CCCS-203b practice test and don't know where to get real CCCS-203b exam questions, then

you are at the right place. PrepAwayExam is offering the actual CCCS-203b Questions that can help you get ready for the examination in a short time. These CCCS-203b Practice Tests are collected by our team of experts. It has ensured that our questions are genuine and updated. We guarantee that you will be satisfied with the quality of our CrowdStrike Certified Cloud Specialist (CCCS-203b) practice questions.

## CrowdStrike Certified Cloud Specialist Sample Questions (Q166-Q171):

### NEW QUESTION # 166

Which of the following is the correct step when setting up an automated assessment schedule for Cloud Security Posture Management (CSPM) in CrowdStrike?

- A. Use the CrowdStrike API to trigger one-time scans only when issues are suspected.
- B. Manually initiate security posture assessments each time a review is required.
- **C. Define a schedule in the CrowdStrike console, specifying the frequency and cloud account scope.**
- D. Enable default cloud provider security tools and assume CrowdStrike will synchronize automatically.

**Answer: C**

Explanation:

Option A: Using the CrowdStrike API to trigger one-time scans can supplement assessments but is not a replacement for an automated schedule. Without regular scans, potential vulnerabilities may go unnoticed, reducing overall security efficacy.

Option B: Manually initiating security posture assessments each time is inefficient and prone to human error. CSPM tools like CrowdStrike support automated scheduling to ensure consistent monitoring and compliance without manual intervention.

Option C: While enabling default cloud provider security tools is a good practice, these tools are separate from CrowdStrike's CSPM capabilities. Assuming synchronization without explicitly setting up a schedule in CrowdStrike will leave the assessments incomplete.

Option D: Defining a schedule in the CrowdStrike console is the correct approach. The console provides options to set frequency (e.g., daily, weekly) and scope (e.g., specific cloud accounts or all accounts), ensuring continuous posture monitoring. This setup is foundational for proactive security management.

### NEW QUESTION # 167

What is the first step in summarizing IAM findings using CrowdStrike Cloud Infrastructure Entitlement Manager (CIEM)?

- A. Manually review all IAM policies across cloud environments.
- **B. Use CIEM's Identity Analyzer to generate a findings summary, highlighting potential risks and misconfigurations.**
- C. Export the CIEM report and analyze it using third-party software.
- D. Conduct a manual penetration test to validate the findings.

**Answer: B**

Explanation:

Option A: While penetration testing is a valuable security practice, it is not the first step in summarizing IAM findings. CIEM's Identity Analyzer is designed to provide immediate insights into IAM misconfigurations.

Option B: CIEM's Identity Analyzer automatically compiles and summarizes findings related to IAM configurations, such as overprivileged accounts, inactive users, and missing MFA. This summary provides actionable insights, allowing administrators to address security gaps efficiently without manual effort.

Option C: This approach is inefficient and error-prone, particularly in complex, multi-cloud environments. CIEM automates the process of identifying IAM issues, making manual reviews unnecessary.

Option D: While exporting data for further analysis can be useful, CIEM provides built-in tools to generate actionable summaries. Using third-party software adds unnecessary complexity and delays remediation.

### NEW QUESTION # 168

What is needed to achieve visibility into the latest AWS IAM 1020 restricted use of AWS CloudShell with the latest CIS Foundations Benchmarks for AWS, Azure, and Google Cloud?

- A. Leverage existing IOA policy
- B. Create custom IOA policy
- **C. Leverage existing IOM policy**
- D. Create custom IOM policy

**Answer: C**

Explanation:

Visibility into AWS IAM controls, including restricted use of AWS CloudShell (CIS IAM 1.20), is provided through CrowdStrike Falcon Cloud Security posture management using Indicators of Misconfiguration (IOMs). These checks continuously evaluate cloud resources against industry-standard benchmarks, including the CIS Foundations Benchmarks for AWS, Azure, and Google Cloud. CrowdStrike maintains prebuilt, managed IOM policies that are automatically updated to reflect the latest CIS guidance. Leveraging existing IOM policies ensures immediate coverage without the operational risk or overhead of creating and maintaining custom rules. These policies assess IAM configurations, permissions usage, service access controls, and policy enforcement related to CloudShell usage.

IOAs are designed for runtime behavioral detections and are not suitable for posture or configuration validation. Creating custom IOMs is unnecessary for CIS-aligned controls because CrowdStrike already provides validated, benchmark-mapped policies maintained by CrowdStrike security research.

Therefore, leveraging existing IOM policies is the correct and recommended approach to maintain continuous, benchmark-aligned visibility across multi-cloud environments.

#### NEW QUESTION # 169

While auditing your cloud environment, you need to identify the last time a specific user changed their password. Which of the following actions should you take in CrowdStrike Identity Analyzer to retrieve this information?

- **A. Use the "Password Change Insights" feature in the Identity Analyzer dashboard.**
- B. Review the "Access Permissions" tab for the user to find the password change timestamp.
- C. Query the cloud provider's API directly for password change events.
- D. Navigate to the user's activity logs and filter by "Authentication Events."

**Answer: A**

Explanation:

Option A: The "Access Permissions" tab focuses on roles, policies, and entitlements. It does not store password change history, making this option incorrect.

Option B: Authentication events show login attempts and session data but do not track password changes. This approach would not yield the desired information.

Option C: The "Password Change Insights" feature in CrowdStrike Identity Analyzer provides a centralized and user-friendly interface to track password change events. It is specifically designed for auditing and identifying such activity efficiently without relying on external tools or manual log searches.

Option D: While querying the cloud provider's API might work, it is time-consuming and requires advanced knowledge of the API. CrowdStrike Identity Analyzer already consolidates this information, making this step unnecessary.

#### NEW QUESTION # 170

After deploying the CrowdStrike Container Sensor in a Kubernetes environment, developers notice significant performance degradation in pod startup times.

What is the most likely cause of this issue?

- **A. The sensor's configuration includes improper resource limits and requests.**
- B. The sensor is overloading the Kubernetes API server with frequent requests.
- C. The Kubernetes nodes are running an unsupported operating system.
- D. The sensor is blocking all traffic to external endpoints by default.

**Answer: A**

Explanation:

Option A: The sensor does not block traffic. Its purpose is to monitor and report, not enforce network traffic rules. Any network issues would typically be related to cluster configuration or network policies, not the sensor.

Option B: If the Container Sensor's resource requests and limits are improperly configured, it can consume excessive CPU or memory, potentially impacting the Kubernetes node and slowing down pod startup times. Ensuring the sensor's resource requirements align with the cluster's capacity is crucial to maintaining performance.

Option C: While running an unsupported OS could cause deployment failures, it is unlikely to cause performance degradation. The sensor checks compatibility during deployment.

Option D: The Container Sensor does not directly interact with the Kubernetes API server in a manner that would overload it.

Admission-related requests are handled by the Admission Controller, which operates independently.
