Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q82-Q87):

NEW QUESTION # 82

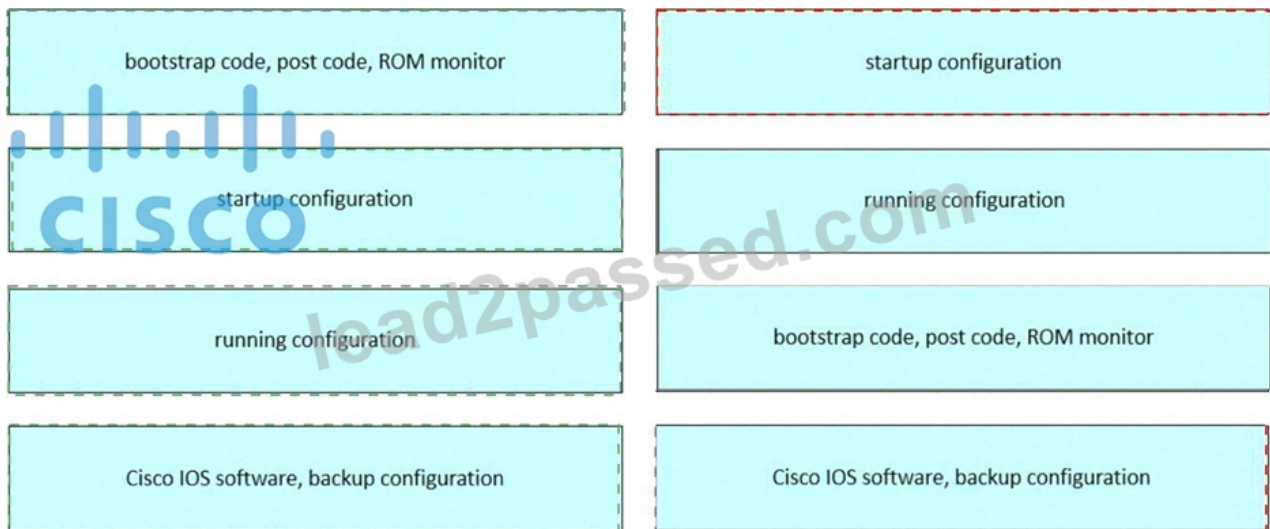

Refer to the exhibit. Drag and drop the functions from the left onto the corresponding internal memory components on the right.

Answer:

Explanation:

Explanation:

NVRAM # Startup configuration

RAM # Running configuration

ROM # Bootstrap code, POST code, ROM monitor

Flash memory # Cisco IOS software, backup configuration

Each memory type in a Cisco device serves a specific function in the boot process and runtime operation.

NVRAM retains configuration across reboots, RAM is volatile and holds active configs, ROM handles initial boot tasks, and flash stores the operating system.

This content is covered thoroughly in "Cisco Equipment and Related Hardware" in the FLDTEC curriculum. Here's the breakdown:

ROM (Read-Only Memory)

- * Stores bootstrap code, POST (Power-On Self-Test), and ROM Monitor.
- * These are essential for the device's initial power-on operations and recovery modes.

NVRAM (Non-Volatile RAM)

- * Holds the startup configuration file, which is loaded during the boot process.
- * Content remains intact after a reboot or power cycle.

RAM (Random Access Memory)

- * Stores the running configuration and current operational state of the router or switch.
- * Also used for routing tables, ARP cache, and packet buffers.
- * Data is lost when the device is powered off or rebooted.

Flash Memory

- * Contains the Cisco IOS image, system files, and can store backup configurations.
- * It is a non-volatile storage, so it retains data after reboots.

NEW QUESTION # 83

What is a feature of Cisco Meraki switches that simplifies the replacement process?

- **A. Cloud-based management**
- B. Built-in configuration wizard
- C. Offline configuration backup
- D. Automatic hardware detection

Answer: A

Explanation:

Cloud-based management is a core feature of Cisco Meraki switches and significantly simplifies the device replacement process.

When a failed switch is replaced:

- * The new hardware can be claimed in the Meraki dashboard.
- * The previously assigned configuration is automatically applied to the replacement device.
- * This eliminates the need for local reconfiguration and ensures continuity with minimal manual effort.

This centralized approach ensures that configurations are stored securely and consistently applied across devices.

NEW QUESTION # 84

Which command is used to determine if there is sufficient space in the memory of a device before installing a new Cisco IOS image?

- A. show memory
- B. show flash:
- C. show storage
- D. show file-system

Answer: B

Explanation:

The `show flash:` command is used to display the contents of the device's flash memory, which is where the Cisco IOS image is typically stored. By issuing this command, a technician can verify available space and determine whether there is enough capacity to accommodate a new IOS image before initiating an upgrade or image replacement process.

This command provides a detailed listing of files, their sizes, and the total and available memory space within the flash file system.

* `show file-system` lists all available file systems but doesn't detail their content.

* `show memory` shows runtime memory usage (RAM), not flash memory.

* `show storage` is not a standard IOS command.

NEW QUESTION # 85

Which cable type should be used when installing replacement hardware and connecting two devices of the same type, like two DTEs or two DCEs?

- A. Rolled RJ-45 to RJ-45 console cable
- B. USB Type A to Type B cable
- C. RJ-45 Ethernet crossover patch cable
- D. RJ-45 Ethernet straight-through patch cable

Answer: C

Explanation:

When connecting two devices of the same type (e.g., two routers, two switches, or two DTEs), a crossover cable is required. This cable swaps the transmit and receive pairs to allow direct communication between devices without the need for an intermediate device like a switch.

* Straight-through cables are used to connect different types of devices (e.g., PC to switch).

* Rolled cables are used for console access.

* USB Type A to B cables are typically used for peripheral device connections, not networking.

NEW QUESTION # 86

Refer to the exhibit. Drag and drop the names of the field-replaceable units from the left onto the corresponding letters on the image of the Cisco NCS 5500 Series modular router.

power supplies

A

transceivers

B

route processor cards

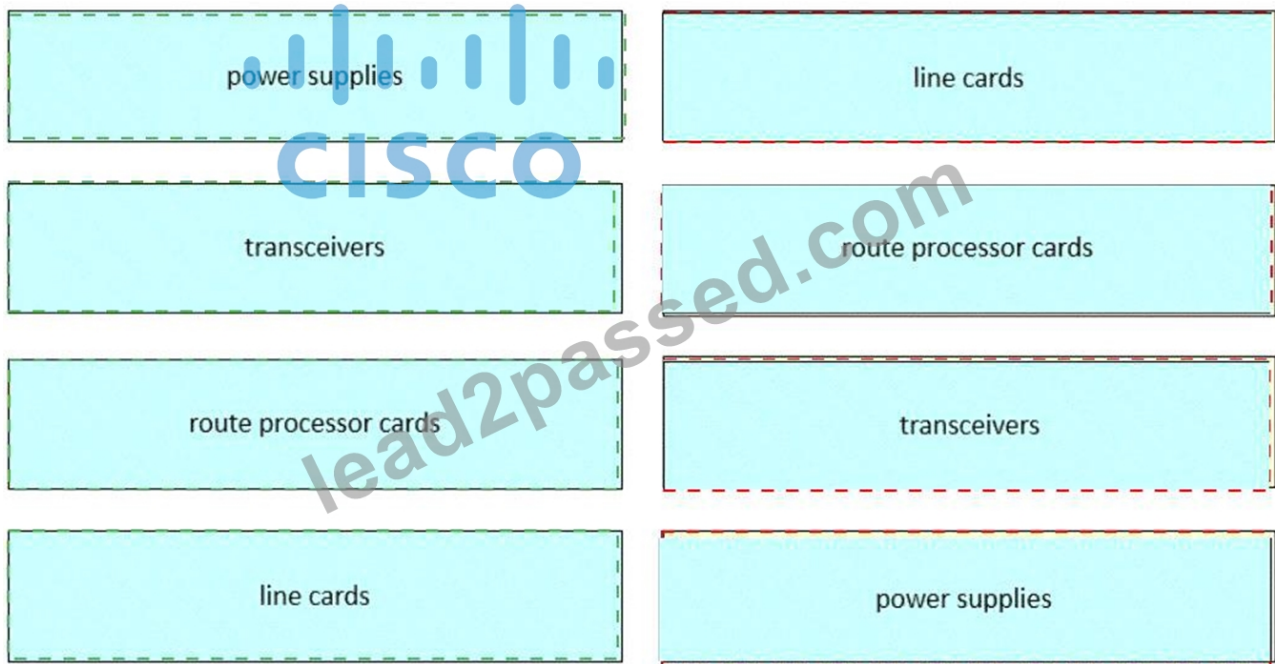

C

line cards

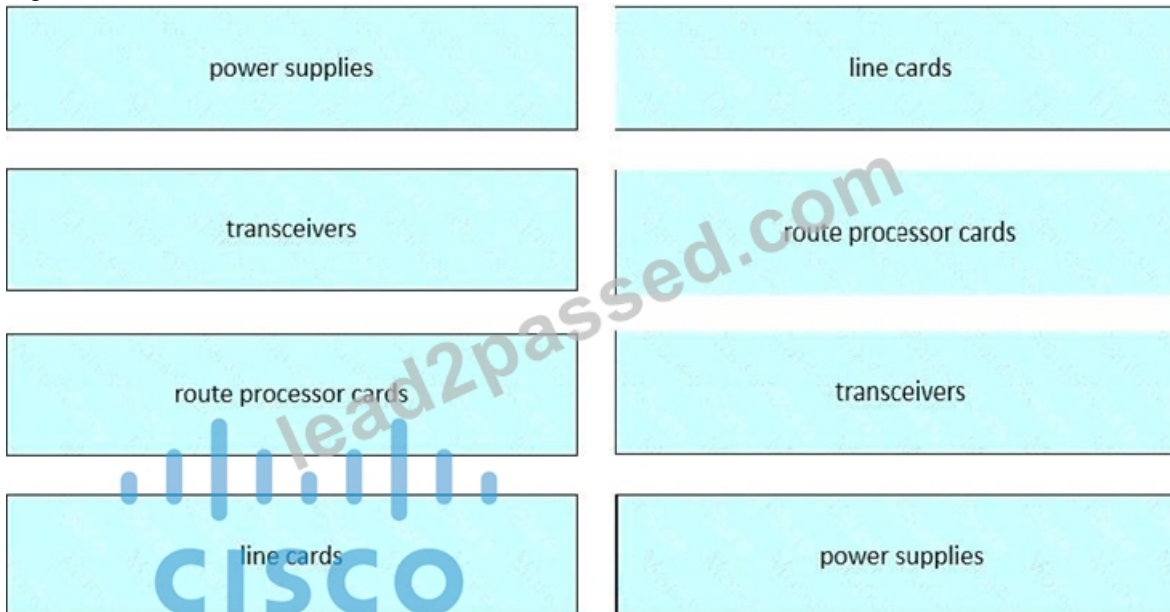

D

Answer:

Explanation:

Explanation:

A # Line cards

Provide the physical interfaces for network connectivity.

B # Route processor cards

Manage routing functions and system control.

C # Transceivers

Installed in the ports of line cards for optical/electrical signal transmission.

D # Power supplies

Provide power to the modular system and are hot-swappable.

Cisco's NCS 5500 Series is designed for service provider and data center deployments. The FLDTEC course outlines the layout of FRUs in modular platforms like this one:

A - Line Cards: Located in the upper slots, these modules handle the bulk of switching and forwarding functions.

B - Route Processor Cards (RP Cards): Positioned centrally, these provide management and control plane services for the router.

C - Transceivers: Installed into the line cards, transceivers provide physical connectivity through optical or copper interfaces.

D - Power Supplies: Located in the bottom rear section, these modules provide redundant and hot-swappable power to the chassis. Recognizing each FRU visually and functionally is critical when performing RMA procedures, component diagnostics, or hardware upgrades in the field.
