## Palo Alto Networks Certified Cybersecurity Practitioner Sample Questions (Q56-Q61):

### NEW QUESTION # 56

What role do containers play in cloud migration and application management strategies?

- A. They enable companies to use cloud-native tools and methodologies.

- B. They are used to orchestrate virtual machines (VMs) in cloud environments.
- C. They are used for data storage in cloud environments.
- D. They serve as a template manager for software applications and services.

**Answer: A**

Explanation:

Containers encapsulate applications and their dependencies into lightweight, portable units that can run consistently across multiple environments. This abstraction supports cloud-native development by enabling microservices architectures, rapid deployment, and scaling within orchestration platforms like Kubernetes.

Containers accelerate cloud migration by decoupling applications from infrastructure, facilitating automation, and continuous integration/continuous deployment (CI/CD) workflows. Palo Alto Networks addresses container security by integrating runtime protection, vulnerability scanning, and compliance enforcement within its Prisma Cloud platform, ensuring safe adoption of cloud-native tools and methodologies.

#### NEW QUESTION # 57

What are two capabilities of identity threat detection and response (ITDR)? (Choose two.)

- A. Analyzing access management logs
- B. Scanning for excessive logins
- C. Securing individual devices
- D. Matching risks to signatures

**Answer: A,B**

#### NEW QUESTION # 58

A user is provided access over the internet to an application running on a cloud infrastructure. The servers, databases, and code of that application are hosted and maintained by the vendor.

Which NIST cloud service model is this?

- A. IaaS
- B. PaaS
- C. CaaS
- D. SaaS

**Answer: D**

Explanation:

According to the NIST definition of cloud computing<sup>1</sup>, there are three service models for cloud computing:

Infrastructure as a Service (IaaS), Platform as a Service (PaaS), and Software as a Service (SaaS). In the SaaS model, the cloud provider delivers the software applications over the internet, and the users access them from various devices through a web browser or a program interface. The cloud provider manages the underlying infrastructure, including the servers, databases, and code of the applications. The users do not need to install, update, or maintain the software, and they only pay for the service they use. The scenario described in the question is an example of the SaaS model, as the user is provided access over the internet to an application running on a cloud infrastructure, and the vendor hosts and maintains the servers, databases, and code of that application.

#### NEW QUESTION # 59

What differentiates knowledge-based systems from behavior-based systems?

- A. Behavior-based systems pull from a previously stored database that distinguishes "bad".
- B. Behavior-based systems find the data that knowledge-based systems store.
- C. Knowledge-based systems pull from a previously stored database that distinguishes "bad". C. Knowledge-based systems try to find new, distinct traits to find "bad" things.

**Answer: C**

Explanation:

Knowledge-based systems and behavior-based systems are two types of artificial intelligence systems that can be used for security purposes. Knowledge-based systems use a predefined database of rules, facts, and patterns that distinguish "bad" or malicious activities from normal ones. They compare the incoming data with the stored knowledge and flag any anomalies or matches.

Behavior-based systems, on the other hand, learn from the observed data and establish a baseline of normal behavior. They then monitor the data for any deviations or changes from the baseline and alert on any suspicious or abnormal activities. References:

#### NEW QUESTION # 60

Which term describes data packets that move in and out of the virtualized environment from the host network or a corresponding traditional data center?

- A. East-West traffic
- B. Interzone traffic
- **C. North-South traffic**
- D. Intrazone traffic

**Answer: C**

Explanation:

North-South traffic refers to the data packets that move between the virtualized environment and the external network, such as the internet or a traditional data center. This traffic typically involves requests from clients to access applications or services hosted on virtual machines (VMs) or containers, or responses from those VMs or containers to the clients. North-South traffic can also include management or monitoring traffic from external devices to the virtualized environment.
