

Valid JN0-351 Exam Braindumps Prep Materials: Enterprise Routing and Switching, Specialist (JNCIS-ENT) - PassReview

2026 Latest PassReview JN0-351 PDF Dumps and JN0-351 Exam Engine Free Share: <https://drive.google.com/open?id=1P3XoAdjecIqNricACJrEc6nrBnk6UIY>

If you are a beginner, start with the JN0-351 learning guide of practice materials and our JN0-351 exam questions will correct your learning problems with the help of the test engine. All contents of JN0-351 training prep are made by elites in this area rather than being fudged by laymen. Let along the reasonable prices which attracted tens of thousands of exam candidates mesmerized by their efficiency by proficient helpers of our company. Any difficult posers will be solved by our JN0-351 Quiz guide.

Juniper JN0-351 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Protocol Independent Routing: An essential domain for understanding routing components outside protocol dependencies, this topic enhances expertise in configuring, monitoring, and troubleshooting critical elements.
Topic 2	<ul style="list-style-type: none"> • BGP: This topic focuses on the operational and conceptual elements of BGP, a cornerstone in enterprise networks.
Topic 3	<ul style="list-style-type: none"> • High Availability: This topic covers the importance and application of high availability within Junos OS environments. Knowledge in configuring and managing these components is critical for ensuring robust and uninterrupted network operations, aligning with exam expectations.
Topic 4	<ul style="list-style-type: none"> • Layer 2 Switching or VLANs: This topic deepens the understanding of Layer 2 switching operations within the Junos OS, including VLAN concepts and benefits. Experienced networking professionals gain insights into configuration, monitoring, and troubleshooting techniques essential for network segmentation and efficiency.
Topic 5	<ul style="list-style-type: none"> • OSPF: The concepts and operational details of OSPF are explored, providing tools for routing efficiency. Configuration and troubleshooting mastery ensure readiness for both the exam and complex enterprise environments.

The PassReview is one of the top-rated and trusted platforms that are committed to making the Juniper JN0-351 exam preparation simple, easy, and quick. To achieve this objective the PassReview is offering valid, updated, and easy-to-use Juniper JN0-351 Exam Practice test questions in three different formats. These three formats are Juniper JN0-351 exam practice test questions PDF dumps, desktop practice test software, and web-based practice test software.

Juniper Enterprise Routing and Switching, Specialist (JNCIS-ENT) Sample Questions (Q83-Q88):

NEW QUESTION # 83

You are receiving multiple BGP routes from an upstream neighbor and only want to advertise a single summarized prefix to your internal OSPF neighbors. This route should only be advertised when you are receiving these BGP routes from this neighbor. In this scenario, which type of route should you create?

- A. static route using the resolve feature
- **B. generate route**
- C. aggregate route
- D. static route using qualified next hops

Answer: B

Explanation:

Both aggregate and generated routes would work, but the best choice is generated routes.

One key difference:

With aggregated routes any prefix in the routing table counts as a contributing route.

With generated routes only prefix with a valid next-hop qualifies.

NEW QUESTION # 84

What is a purpose of using a spanning tree protocol?

- A. to look up MAC addresses
- B. to tunnel Ethernet frames
- **C. to eliminate broadcast storms**
- D. to route IP packets

Answer: C

Explanation:

A broadcast storm is a network condition where a large number of broadcast packets are sent and received by multiple devices, causing congestion and performance degradation. A broadcast storm can occur when there are loops in the network topology, meaning that there are multiple paths between two devices.

A spanning tree protocol is a network protocol that prevents loops from being formed when switches or bridges are interconnected via multiple paths. It does this by creating a logical tree structure that spans all the devices in the network, and disabling or blocking the links that are not part of the tree, leaving a single active path between any two devices.

By eliminating loops, a spanning tree protocol also eliminates broadcast storms, as broadcast packets will not be forwarded endlessly along the looped paths. Instead, broadcast packets will be sent only along the tree structure, reaching each device once and avoiding congestion.

NEW QUESTION # 85

Which two statements about redundant trunk groups on EX Series switches are correct? (Choose two.)

- **A. If the active link fails, then the secondary link automatically takes over.**
- B. Redundant trunk groups load-balance traffic across two designated uplink interfaces.

- C. Redundant trunk groups must be connected to the same aggregation switch.
- D. Layer 2 control traffic is permitted on the secondary link

Answer: A,C

Explanation:

Explanation

Redundant Trunk Groups (RTGs) on EX Series switches provide a simple solution for network recovery when a trunk port on a switch goes down¹. They are configured on the access switch and contain two links: a primary or active link, and a secondary link¹. Therefore, option B is correct because if the active link fails, the secondary link automatically starts forwarding data traffic without waiting for normal spanning-tree protocol convergence¹.

Option D is also correct. In a typical enterprise network composed of distribution and access layers, RTGs are used where one Access switch is connected to two different uplink switches². This implies that RTGs must be connected to the same aggregation switch².

NEW QUESTION # 86

Your GRE tunnel is not transitioning to the Upstatus. What would be the first step in troubleshooting the problem?

- A. Verify tunnel endpoint reachability.
- B. Verify that the routing instance for GRE tunnels is created.
- C. Verify that the status of the management interface is up.
- D. Verify the status of the management routing instance.

Answer: A

NEW QUESTION # 87

You are a network operator who wants to add a second ISP connection and remove the default route to the existing ISP. You decide to deploy the BGP protocol in the network.

What two statements are correct in this scenario? (Choose two.)

- A. IBGP peers advertise routes received from EBGP peers to other IBGP peers.
- B. EBGP peers advertise routes received from IBGP peers to other EBGP peers.
- C. IBGP peers advertise routes received from IBGP peers to other IBGP peers.
- D. IBGP updates the next-hop attribute to ensure reachability within an AS.

Answer: A,B

Explanation:

BGP is a routing protocol that operates between autonomous systems (AS). An AS is a group of routers under a single administrative control. BGP can be classified into two types: internal BGP (IBGP) and external BGP (EBGP). IBGP is the BGP communication between routers within the same AS, while EBGP is the BGP communication between routers in different AS. BGP uses the AS_PATH attribute to record the AS numbers that the route has passed through, and uses it to prevent routing loops and select the best path.

In this scenario, you want to add a second ISP connection and remove the default route to the existing ISP.

This means that you want to have more control over the routing decisions and use BGP to exchange routes with both ISPs. To do this, you need to deploy the BGP protocol in your network and configure both IBGP and EBGP sessions. The correct statements about BGP in this scenario are:

* IBGP peers advertise routes received from EBGP peers to other IBGP peers. This is the default behavior of IBGP, as it allows the routers within the same AS to learn the routes from different EBGP peers and select the best exit point. However, IBGP has a rule that it does not advertise routes received from IBGP peers to other IBGP peers, to avoid creating routing loops. Therefore, option B is correct and option C is incorrect. To overcome this rule, IBGP requires a full mesh topology, where every IBGP router is directly connected to every other IBGP router, or a route reflector or confederation design, where some IBGP routers act as intermediaries to reflect or aggregate the routes to other IBGP routers.

* EBGP peers advertise routes received from IBGP peers to other EBGP peers. This is the default behavior of EBGP, as it allows the routers in different AS to exchange routes and reachability information. However, EBGP has a rule that it does not advertise routes received from EBGP peers to other EBGP peers, to avoid creating routing loops. Therefore, option D is correct and option A is incorrect. To overcome this rule, EBGP uses the AS_PATH attribute to filter out the routes that contain its own AS number, or uses route maps or policies to control the route advertisement. IBGP does not update the next-hop attribute to ensure reachability within an AS, as the next-hop attribute is preserved by IBGP. Instead, IBGP relies on an underlying IGP (Interior Gateway

Protocol) to provide reachability to the next-hop.

NEW QUESTION # 88

.....

PassReview provides one of the most comprehensive and high-quality Enterprise Routing and Switching, Specialist (JNCIS-ENT) Exam Questions. We cut through the nonsense and made Enterprise Routing and Switching, Specialist (JNCIS-ENT) exam preparation useful, to get your Enterprise Routing and Switching, Specialist (JNCIS-ENT) certification on the first try. Our Enterprise Routing and Switching, Specialist (JNCIS-ENT) JN0-351 Questions include real-world questions that will help you learn the fundamentals of the topic not only for the Enterprise Routing and Switching, Specialist (JNCIS-ENT) JN0-351 exam but also for your future profession.
