NEW QUESTION # 204

BFD can implement millisecond-level link status detection.

- A. FALSE
- B. TRUE

Answer: B

Explanation:

Understanding BFD (Bidirectional Forwarding Detection)

BFD is a high-speed fault detection protocol used to monitor link failures in milliseconds.

It operates at Layer 2 (Data Link Layer) and Layer 3 (Network Layer) to provide fast convergence.

Why Can BFD Detect Failures in Milliseconds?

Uses lightweight control packets that are exchanged between routers.

Works with OSPF, IS-IS, BGP, and MPLS to trigger fast convergence.

Detection time = (Transmit Interval) × (Detect Multiplier)

Example: If the interval is 3ms and the multiplier is 3, failure detection takes 9ms.

Why is the Answer TRUE?

BFD achieves millisecond-level detection by sending rapid probe packets.

Used in high-availability networks where link failures must be detected in real-time.

Real-World Application

Service Provider Networks: BFD improves network resilience by detecting link failures faster than traditional routing timers.

Enterprise WANs: Used in SD-WANs to switch paths dynamically.

MPLS Fast Reroute (FRR): Works with MPLS Traffic Engineering for near-instantaneous failover.
