問題 #71

A combination of refractory grain and suitable bonding agent that, after the addition of a proper liquid, is generally poured into place to form a refractory shape or structure which becomes rigid because of chemical action is called

- A. all of the above
- **B. castable**
- C. mortar
- D. ceramic modules

答案： B

問題 #72

The best definition for creep is:

- **A. deformation due to continuous load over time.**
- B. cracking caused by thermal shock.
- C. an increase in expansion at high temperatures.
- D. shrinkage at high temperatures.

答案： A

解題說明：

Creep in refractories is the slow, time-dependent deformation of a material under constant stress and high temperature. It is critical in applications like reformers and furnaces where the refractory is under load for extended periods. The amount of deformation is typically measured over 50-100 hours in standardized tests such as ASTM C832.

Creep is not the same as thermal expansion (which is reversible), or cracking (a sudden failure).

Reference:

API TR 981 - Thermal Expansion Under Load and Creep of Refractories, defines creep as deformation due to a sustained load over time under high temperatures

問題 #73

The application of monolithic refractories by means of air placement guns is

- **A. Gunning**
- B. Placing
- C. Pouring
- D. Casting

答案： A

問題 #74

- A. the mixed material can sit prior to use.
- **B. material may be stored and remains in usable condition.**
- C. for material tests (expiration of test results).
- D. it takes for products to be manufactured and installed.

答案： B

解題說明：

Shelf life is defined as the maximum period during which a material may be stored under specified conditions and still remain in a
