UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q62-Q67):

NEW QUESTION # 62

Which three roles from the Implementation Team participate in the Process Analysis stage?

- A. Solution Architect, Project Manager, Business Analyst
- B. Business Analyst, Infrastructure Engineer, Project Manager
- C. Project Manager, Developer, Client IT
- D. Automation Developer, Solution Architect, Client SME

Answer: A

Explanation:

During the Process Analysis stage, the following three key roles from the Implementation Team are involved:

- * Solution Architect
- * Project Manager
- * Business Analyst

Each role brings a unique perspective and responsibility to the analysis. The business analyst focuses on understanding the business goals and documenting the As-Is process. The solution architect evaluates the process from a technical standpoint to identify automation opportunities and potential roadblocks. The project manager oversees the planning and timelines to ensure alignment with the broader project goals.

This collaborative analysis results in a comprehensive and well-documented Process Definition Document (PDD), which becomes the foundation for the subsequent design and development phases. This stage is critical to ensuring that the correct processes are chosen for automation and that the team is aligned on the scope and expectations.

NEW QUESTION # 63

Which role is responsible for overseeing access needs for Studio and Orchestrator during technical validation?

- A. Infrastructure Engineer
- B. Project Manager
- C. Solution Architect
- D. Automation Developer

Answer: C

Explanation:

The Solution Architect is responsible for overseeing access requirements for UiPath tools such as Studio and Orchestrator during the Business Case and Technical Validation stage. They identify what access the developers, robots, and other roles will require to successfully design, develop, and run automations.

This includes determining:

- * Application credentials needed for bots
- * Role-based access for developers
- * Orchestrator permissions for robot scheduling and asset use
- * Environment setup and connectivity

Ensuring access is defined early prevents blockers during development and testing. The Solution Architect collaborates with the Infrastructure Engineer and Client IT Team to secure and document these requirements.

NEW QUESTION # 64

Which of the following roles is responsible for defining the automation architecture and advising the development team?

- A. Business Analyst
- B. Infrastructure Engineer
- C. Solution Architect
- D. Automation Developer

Answer: C

Explanation:

The Solution Architect plays a pivotal role in automation projects by defining the overall automation architecture, acting as the technical lead, and advising the development team on implementation approaches.

Their responsibility is to ensure that the solution design aligns with the automation goals, technical standards, and scalability requirements.

They collaborate closely with the business analyst to understand the process requirements and then map out a future-state process by selecting suitable tools, frameworks, and best practices. Solution architects also evaluate integration requirements, security considerations, infrastructure dependencies, and performance expectations.

Throughout the automation lifecycle - from solution design to development, UAT, and deployment - the solution architect remains involved to resolve technical issues, optimize the design, and validate the solution's robustness. Their involvement ensures technical consistency and quality across all stages of implementation.

NEW QUESTION # 65

What does Automation Implementation Methodology ensure?

- A. Inconsistent delivery quality with flexible tools
- B. Increased cost of automation with flexible timelines
- C. Consistent quality, faster and more reliable implementations, and quicker process handovers
- D. Independent project execution with minimal team coordination

Answer: C

Explanation:

The UiPath Automation Implementation Methodology ensures consistent quality, faster and more reliable implementations, and quicker process handovers by establishing a structured and well-defined approach to automation projects. This methodology includes stages from kickoff to project closure, each involving specific stakeholders, defined deliverables, and quality assurance measures.

The methodology helps organizations deliver automation projects in a repeatable and predictable way, reducing variability in outcomes and enhancing stakeholder satisfaction. It incorporates best practices that align the Client Team and the Implementation Team, ensuring both sides have clear expectations and roles. It also facilitates early identification of risks, effective communication, and streamlined deployment, which leads to faster turnarounds.

Moreover, by following a proven framework, the implementation team can avoid redundant efforts, minimize rework, and focus on value creation. This ultimately leads to more scalable and maintainable automation solutions, reduced time-to-value, and smoother transitions from development to production.

NEW QUESTION # 66

What is the output of the Solution Design stage in the UiPath Automation Implementation Methodology?

- A. Hypercare Support Plan
- B. Process Definition Document (PDD)
- C. Automation Test Plan
- D. Approved Solution Design Document (SDD)

Answer: D

Explanation:

The main deliverable from the Solution Design stage is the Approved Solution Design Document (SDD).

This document contains a detailed description of the To-Be automation flow, including technical components, workflow modules, system interactions, exception handling strategies, and deployment plans.

The solution architect leads this stage, working with the automation developers and project manager to translate the requirements documented in the PDD into a scalable, modular, and efficient automation architecture. The SDD serves as the blueprint for the development team, ensuring consistency and clarity in how the automation should be built.

This document also includes details on infrastructure, access requirements, assumptions, dependencies, and constraints. A well-documented and approved SDD reduces development time, minimizes rework, and increases the likelihood of successful testing and deployment.
